FAMILY COMPUTING

“So far as we are concerned,
Paper Clip is the top word processor
running on a micro computer.”

—Home Applications For The C-64

“Paper Clip is one of the easiest
of the professional word processors to use,
with a sensible manual and plenty of aids for the accident-prone.”

—Computing Now

PaperClip™

- 20,000 word dictionary
- User expandable dictionary
- Highlights words and documents not found in dictionary for spelling confirmation
- Re-arranges words, sentences, paragraphs, and pages with a few keystrokes
- Easy to learn, easy to use!
- 40 & 80 column output
- Compatible with virtually every printer available
- Compatible with The Consultant Database™

The Power, Flexibility and Ease of use
that Paper Clip users rave about,
combined with the infallibility
of Spell Pack.
For those who want the best in
full word processing

FROM CLAY TABLETS, THROUGH PARCHMENT, GUTENBERG AND BEYOND, MAN HAS SEARCHED FOR THE ULTIMATE METHOD TO STORE, SORT AND PRINT THE WRITTEN WORD. NOW, BATTERIES INCLUDED PROVIDES THAT METHOD, THE PAPER CLIP FAMILY. AN OUTSTANDING WORD PROCESSOR AND SPELLING CORRECTION SYSTEM FOR ALL COMMODORE COMPUTERS — AND COMING SOON FOR APPLE AND ATARI.

ISSUE NO. 17

MAY 1985

Ahoy! (#8750-4383) is published monthly by Ion International Inc., 45 W. 34th St., Suite 407, New York, NY, 10001. Subscription rate: 12 issues for \$19.95, 24 issues for \$37.95 (Canada \$26.95 and \$49.95 respectively). Second class postage paid at New York, NY 10001 and additional mailing offices. © 1985 by Ion International Inc. All rights reserved. © under Universal International and Pan American Copyright conventions. Reproduction of editorial or pictorial content in any manner is prohibited. No responsibility can be accepted for unsolicited material. Postmaster, send address changes to Ahoy!, 45 W. 34th Street, Suite 407, New York, NY 10001. Direct all address changes or matters concerning your subscription to Ahoy!, P.O. Box #341, Mt. Morris, IL 61054. All editorial inquiries and software and hardware to be reviewed should be sent to Ahoy!, 45 W. 34th St., Suite 407, New York, NY 10001.

VIEW FROM THE BRIDGE

On the night they hand out awards for speed, versatility, and dependability, the Commodore 1541 need not rent a tux. Third party drives like the MSD SD-2 and the Indus GT have bested it in every category but price. If that last word prompted you to say, "Aha! But see?", then you probably wouldn't even consider upgrading. And why should you? For the price you probably paid, your Commodore 1541 does a more than adequate job. And it will do an even better job after you soup it up with the programs in this issue of *Ahoy!*

- The most important program, unfortunately, you'll have to buy. In the conclusion to *Disk Spinners*, Morton Kevelson examines three best-selling drive accelerators—Fast Load, *Kwik-Load!*, and 1541 Flash—and helps you choose the package that's right for your needs. (Turn to page 33.)

- Once you've sped up your 1541 you can speed up your ability to access it with *Dos Plus*. Dennis Muscatelli's C-64 utility puts a powerful tool kit at your fingertips. (Turn to page 39.)

- Examining and modifying disk files is interesting and useful. Going through standard file processing routines to do so is tedious. Mark Johansen's Disk Display and Update Utility (*DSKDU* to you) gives you direct access to any sector on a disk. (Turn to page 25.)

- You'll never be able to bounce bullets off your disk drive. But *Super Duper* by Dave Barron (not *Ahoy!*'s Technical Editor, but a Mississippi-based programmer) will at least let you copy sequential or program files, rename files, and dupe ML programs without knowing starting and ending addresses. (Turn to page 29.)

- If there's anything worse than a word processor that scrolls horizontally, it's a disk directory that scrolls vertically—namely, any C-64 disk directory that contains 25 or more entries. But *Two-Column Directory* by Richard Lovett and Barry Archer will let you view 40 file names at a glance. (Turn to page 30.)

We figure that's about all the sprucing up your disk operations can handle in one month. As for the rest of the programs and features in this issue:

- The *Commodore Font Editor* by Adventure International programmer Phillip Case will allow you to easily create your own personalized characters or character sets on the C-64. (Turn to page 82.)

- Cal Overhulser's article/program on the *Hardware Interrupt Wedge for the VIC 20 and C-64* will teach you to set up and utilize a "wedge" into either computer's interrupt handler and perform various actions in the background of your main program. (Turn to page 52.)

- Ready for fun and games? So are we! Larry Murdock's *Tile Time* for the C-64 is similar to those sliding number puzzles you used to buy at the dime store—but with infinitely more possibilities and infinitely less wear on your thumbs. (Turn to page 81.)

- Don't get the butterflies playing *Raid* for the C-64, by Larry Coats and Noel Nyman. More important: don't let the butterflies get you! They're out to do just that as you try to scoop up all the inhabitants of Heartland. (Turn to page 60.)

- It's been four months since you took soldering iron and drill in hand to accompany Tom Benford, the original hardware hacker, on a computer-carving adventure. This month he shows you *How to Install a Reset Switch on your VIC or 64*, permitting you to clear screen and memory without interrupting power to the rest of your computer. (Turn to page 13.)

- The thought of drilling into the side of his precious C-64 agonized Morton the K to such an extent that he decided to contribute a companion article to Tom's, detailing alternate ways of installing a reset, or "warm boot," capacity. Morton's love for his computer is evident in the very title of *How Many Ways Can I Reset Thee? Let Me Count the Ways*. (Turn to page 16.)

If you don't know assembly/machine language, and if you missed our April issue, we recommend that you borrow a copy and read the first installment of Mark Andrews' *Commodore Roots*. Then read the second installment, found in this issue: *By the Numbers*. There's no more painless introduction to assembly language programming to be found anywhere. Included this month is a program that will easily convert numbers from decimal to hexadecimal to binary. (Turn to page 47.)

And while your brain is in a machine language mode, read this month's *Rupert Report*. Dale takes you on an assortment of *Assembler Escapades*, showing you how to use an assembler to create an ML program, use a disassembler to view that program in memory, and convert the ML instructions into the DATA statements of a BASIC program. (Turn to page 55.)

A passel of programs are likewise included in this month's edition of *Creating Your Own Games on the VIC and 64*, in which Orson Scott Card details the logistics of *Moving Through Color Memory*—and manipulating colors separately from characters in your original game programs. (Turn to page 18.)

Do we envy you readers. As we write these words, it'll be several weeks before we can page through a copy of the May *Ahoy!* You can tear into one right now. What are you waiting for?

—David Allikas

New Number for Ahoy! BBS (as of April 15): 718-383-8909. (See page 77.)

SCUTTLEBUTT

4K RAM ROBOT • GENERAL ELECTRIC PERIPHERALS • REAL ESTATE ADVISOR • ALPHACOM PRINTER • CARTRIDGE COPIER • BOOK RELEASES • NEW GAMES BY ELECTRONIC ARTS, MICROPROSE, GAMESTAR • MUSIC INSTRUCTION • BULLETIN BOARD NEWS FROM ECHO, COMPUSERVE • UNDERWARE RIBBON • RESET BUTTON

CARTRIDGE COPIER

In an upcoming issue, Morton Kevelson will report on various products that let you put your C-64 programs on cartridges. Among these will be the new CBUS cartridge backup system from R.J. Brachman Associates.

The system consists of two parts: CBUS-1, which lets you copy the contents of any C-64 cartridge onto diskette; and the CBUS-2 cartridge emulator, a cartridge containing 16K RAM which allows you to load the previously copied cartridge program back into the computer and completely emulate the original.

While makers of cartridge-based software are sure to denounce CBUS for its inevitable promotion of piracy, the system does in fact provide two important advantages for law-abiding users. First, it eliminates the need to continuously swap cartridges to change programs, saving wear and tear on the expansion port. Second, it provides a valuable development tool for those who want to create cartridge-based software by allowing for rapid testing and emulation of cartridge-based programs without the need to continuously erase and reprogram read-only memory chips (PROMs).

Cost of CBUS 1 is \$34.95, \$49.95 for deluxe version with accessory programs on disk. CBUS 2 is \$84.95, \$99.95 including disk. A combination package, including all programs and hardware, is \$119.95. Advanced users should inquire about the technical manual for the system.

R.J. Brachman Associates, Inc., P.O. Box 1077, Havertown, PA 19083 (phone: 215-622-5495; for orders 1-800-CBUS-C64).

Alphacom Aero: 130 cps print speed, 2K data buffer, path-seeking logic. READER SERVICE NO. 196

ALPHACOM PRINTER

The \$249.95 Alphacom Aero offers 130 character per second print speed, 2K data buffer, and path-seeking logic. 6 X 8 characters are printed with true descenders in a 6 X 9 dot matrix field. The 9-wire print head (using square needles for maximum image quality) prints either 480 or 960 dots per line in alphanumeric (allowing 96 ASCII characters) or bit-image mode. Users may create their own character sets, and mix type styles (double strike, enlarged, etc.) on the same line. Models for both RS232 and Centronics interfaces are available.

Additionally, Alphacom has cut the price of the intelligent printer cartridge interfaces that link its Alphapro 101 daisy wheel printer (see February's *Scuttlebutt*) to various computers. Price of the particular interface required by Commodore users has dropped from \$49.95 to \$29.95.

Alphacom, Inc., 2323 South Bascom Avenue, Campbell, CA 95008 (phone: 408-559-8000).

WHEN THE RAIN COMES...

Rainy Day Fun is the first in Thorn EMI's new Computer Clubhouse series, designed for children aged 5-9 with the goal of providing activities that entertain while teaching a variety of personal and social skills.

The two-disk set (\$39.95) features 10 C-64 programs: *Mask Maker* (choose from 36 different face parts to create over 700 different masks that can be printed and worn), *Paper Airplane* (10 designs to print, with animated forward and backward rolls), *Pin the Tail on the Donkey* (find visible and invisible donkeys via musical clues), *Connect-the-Dots* (create 40 pictures by connecting dots freehand or on the computer), *Party Invitation Maker* (create your own or pick from three predefined

Keep the tykes out of your hair.
READER SERVICE NO. 197

designs), *Sliding Puzzles* (alphabet, number, and picture puzzles solved by moving squares around a 4 X 4 grid), *Banner Maker* (print banners up to 40 feet long), *Fortune Teller* (friendly sorcerer answers questions), *Coloring Book* (color onscreen or on a printout), and *Mouse Maze* (help Mortimer the Mouse escape from the labyrinth).

Thorn EMI Computer Software, 3187C Airway Avenue, Costa Mesa, CA 92626 (phone: 714-751-3778).

ED SOFTWARE CATALOG AND NEWSLETTER

DLM's 1985 catalog features descriptions and sample screens of over 40 educational programs, many for the Commodore 64.

DLM, One DLM Park, Allen, TX 75002 (phone: in TX 800-442-4711; rest of US 800-527-4747).

Educational Activities has announced *Software Source*, a quarterly newsletter to be mailed free to all its customers on a quarterly basis. Included are questions and answers, software and hardware tips, and information on the company's latest products.

Educational Activities, Inc., P.O. Box 392, Freeport, NY 11520

(phone: in NY, HI, and AK 516-223-4666; rest of US 800-645-3739).

GREEN ACRES

Designed to assist anyone thinking of becoming one, *Real Estate Investor* will calculate mortgage payments for conventional, adjustable rate and balloon payments, mortgage amortization of principal and interest, depreciation (based on the 1981 Economic Recovery Act schedule), and projected cash flow and taxable income. For the C-64; \$35.00.

Jance Associates, Inc., P.O. Box 234, East Texas, PA 18046 (phone: 215-398-0434).

MUSIC LESSONS

Keyboard Crazy consists of four games that teach children music fundamentals: *Melody Machine* (play music while learning notes on the staff and keyboard), *Sneak-a-Peek* (match notes and note names), *Copy Cat* (reproduce notes and songs), and *Mouse Maze* (move the rodent through obstacles by playing the proper note). Included is a coloring book that works in conjunction with the programs. For the 64; \$24.95.

Waveform Corporation, 1912 Bonita Way, Berkeley, CA 94704 (phone: 415-841-9866).

PRINTOUT

The latest book releases of interest to Commodore users:

Commodore 64 Basics: A Self-Teaching Guide (\$15.95) offers a comprehensive course in writing and programming in BASIC, while *Programming Tips for the Commodore 64* (\$14.95) teaches the more sophisticated skills needed to create graphics, animation, music, and sound effects. John Wiley & Sons, Inc., 605 Third Avenue, New York, NY 10158 (phone: 212-850-6000).

Home Applications and Games for the Commodore 64 features 31 programs ranging from home finance to *Beowulf vs. Grendel*. \$14.50 from Little, Brown and Company, 34 Beacon St., Boston, MA 02106 (phone: 617-227-0730).

Keyboard Challenge with Commodore 64 (\$12.95) combines literacy

BASIC programming self-taught.
READER SERVICE NO. 198

training with specific subjects in 29 games like *Geography Invaders*, *Fraction Reaction*, and *Vocabulary War*. *Assembly Language Programming with the Commodore 64* (\$14.95) teaches writing, debugging, and executing assembly language programs. *Commodore 64 BASIC for Kids* (\$15.95) provides over 200 exercises for elementary to junior high school students. All from Brady Communications Co., Inc., Bowie, MD 20715 (phone: 301-262-6300).

Bowker's 1985 Complete Sourcebook of Personal Computing lists more than 750 personal computers, 2500 peripherals, 1800 user groups, 545 magazines, 6300 books, and 3300 reviews. \$19.95 from R.R. Bowker Company, 205 East 42nd St., New York, NY 10017 (phone: 212-916-1600).

TELECOM NEWS

The *Sixth Sense* terminal program from Microtechnic Solutions can make decisions and perform actions based on user-programmed parameters (such as time of day and external events), allowing it to do your telecommunicating while you're out. Other features are a 700 line virtual screen with bidirectional scrolling, standard screen for use with built-in editor, split-screen line input, and si-

Flight Simulator II

For
the Commodore 64™

Put yourself in the pilot's seat of a Piper 181 Cherokee Archer for an awe-inspiring flight over realistic scenery from New York to Los Angeles. High speed color-filled 3D graphics will give you a beautiful panoramic view as you practice takeoffs, landings, and aerobatics. Complete documentation will get you airborne quickly even if you've never flown before. When you think you're ready, you can play the World War I Ace aerial battle game. Flight Simulator II features include ■ animated color 3D graphics ■ day, dusk, and night flying modes ■ over 80 airports in four scenery areas: New York, Chicago, Los Angeles, Seattle, with additional scenery areas available ■ user-variable weather, from clear blue skies to grey cloudy conditions ■ complete flight instrumentation ■ VOR, ILS, ADF, and DME radio equipped ■ navigation facilities and course plotting ■ World War I Ace aerial battle game ■ complete information manual and flight handbook.

GE's TXP-1000 prints in 16 dot matrix on rolled, fanfold, or cut sheet paper.
READER SERVICE NO. 199

Marina del Rey, CA 90292 (phone: 213-823-8415).

BETTER CONNECTION

The price of The Connection interface from Tymac (see *Printer Interfacing*, March '85 *Ahoy!*) has been lowered from \$119.95 to \$99.95. It's also been enhanced to configure to most parallel printers via software, and to include a programmable character set which can be downloaded to create various type styles, as well as a universal screen dump for black and white and popular color printers.

Tymac Controls Corporation, 127 Main Street, Franklin, NJ 07416 (phone: 201-827-4050).

GE PERIPHERALS

General Electric's announcement that they will produce peripherals for specific home computer systems (including Commodore) puts the competition among third party manufacturers in a new light. Because GE is the first entrant in the Commodore market capable of swallowing all the

other third party manufacturers put together, they have the wherewithal to drive prices down below other companies' profit margins. The prices of the releases described here may not appear trendsetting—but wait until the other giants of the home electronics field follow GE's lead into the Commodore market. Small, independent manufacturers of quality peripherals will continue to sell to the quality conscious; the me-too manufacturers will cease to be.

The model 3-8200 modem, operating at 300 baud, includes both an acoustic coupler for hard-wired phones and a direct mode for use with modular jacks. Other features include automatically switchable answer/originate modes and battery operation. Price: \$119.95.

The TXP-1000 printer operates at 25 or 50 characters per second, with full graphics capability and variable width print modes. The \$299.95 unit hooks up to the C-64 via an \$89.95 interface.

Why no Commodore-compatible disk drive? GE is waiting to perfect the one they're currently working on—which will read data files from all home computers.

General Electric Company, Electronics Park, Syracuse, NY 13221 (phone: 315-456-2446).

GE 3-8200 modem is acoustic/modular.
READER SERVICE NO. 200

NEW GAME RELEASES

Despite the witty title variation, Electronic Arts' *Racing Destruction Set* is one of the two latest entries in

Kennedy Approach: rule the skies.
READER SERVICE NO. 205

its Construction Set line, enabling the user to customize and combine a host of supplied elements into an original program. Provided are some of the world's most famous tracks (Monaco, Indianapolis, etc.), nine types of vehicles ranging from Lunar Excursion Modules to stock cars, four different backgrounds, and variable sound effects.

The track can be changed segment by segment, with three widths, seven elevations, and three surface options (ice, dirt, and paving) available. Players can lay land mines and oil slicks in one another's path, or even alter gravity. Vehicles can be changed with regard to speed, tire type, amount of armor, and design. An isolated camera display with split-screen scrolling enables each player to view his car and its position on the track no matter where his opponent is.

Mail Order Monsters lets players design their own beasts from a catalog of 12 body types, 20 enhancements (fangs, tentacles, etc.), 15 weapons, and 6 defenses. Completed monsters can be sent to demolish one another in three different battle scenarios on three skill levels. You can save your most revolting creations to disk for future customization and gameplay.

Both for the C-64; \$35.00 each.

Electronic Arts, 2755 Campus Drive, San Mateo, CA 94403 (phone: 415-571-7171).

By putting the entire track on-screen, Gamestar's *On-Track Racing* eliminates the need to pause or restart when one player gets too far ahead of the other (as in scrolling race games) or sacrifice drama by

splitting the screen. The competition takes place on 10 famous raceways. For the 64 and 128; \$29.95.

Gamestar, Inc., 1302 State Street, Santa Barbara, CA 93101 (phone: 805-963-3487).

The winning entry in Progressive Peripherals' contest challenging users to build levels from the *Wizard* construction set for a second game, the *Wizard Expansion Set* is a more demanding version than the original (required in order to play the *Expansion Set*). For the C-64; \$29.95.

Progressive Peripherals & Software, 2186 South Holly, Suite #2, Denver, CO 80222 (phone: 303-759-5713).

Ousted air traffic controllers can wax nostalgic playing *Kennedy Approach*, simulating the control tower situation at various American airports. Up to twenty aircraft can be radioing you at one time (utilizing speech synthesis); you must guide them all to a safe landing. For the C-64; \$34.95.

MicroProse Software, 120 Lakefront Drive, Hunt Valley, MD 21030 (phone: 301-667-1151).

Two games previously announced by Tymac, now available for the first time, at \$39.95 each:

As *Gandalf the Sorcerer*, you use power bolts to defend your castle from the lizardmen who seek to steal

your treasure and drag your apprentices off to Lizard Lair. On disk or cassette for the 64, on cartridge or cassette for the VIC.

Flyer Fox utilizes 3D graphics and software-generated speech to put you in the cockpit of a jet fighter, defending commercial airliners from murderous Migs. On disk or cassette for the C-64.

Tymac Controls Corporation, Franklin, NJ 07416 (phone: 201-827-4050).

4K RAM ROBOT

Sure to be a riot at the school science fair, The Memocon Crawler is a 5½" diameter robot that can be maneuvered with a seven-function controller or a C-64 (via a special interface). The 4K RAM automaton can go forward, right, or left, pause, sound a buzzer, light an LED, or repeat a program continuously. Robot and controller is \$74.95; C-64 interface (assembly required) is \$39.95.

OWI Inc., 1160 Mahalo Place, Compton, CA 90220 (phone: 213-638-4732).

T-64

A column as densely packed with hard news as *Scuttlebutt* needs some diversion. It's provided this month by Diversions Inc., makers of the Underware Ribbon, which allows you

Break the BASIC language barrier

VIDEO BASIC-64 - ADD 50+ graphic and sound commands to your programs with this super development package. You can distribute free RUN-TIME version without paying royalties!
ISBN# 0-916439-26-7 \$59.95

BASIC COMPILER 64 - compiles the complete BASIC language into either fast 6510 machine language and/or compact speedcode. Get your programs into high gear and protect them by compiling.
ISBN# 0-916439-17-8 \$39.95

MASTER-64 - professional development package for serious applications. Indexed file system, full screen management, programmer's aid, BASIC extensions, 100 commands.
ISBN# 0-916439-21-6 \$39.95

PASCAL-64 - full Pascal with extensions for graphics, sprites, file management, more. Compiles to 6510 machine code and can link to Assembler/Monitor routines.
ISBN# 0-916439-10-0 \$39.95

ADA TRAINING COURSE - teaches you the language of the future. Comprehensive subset of the language, editor, syntax checker/compiler, assembler, disassembler, 120+ page guide.
ISBN# 0-916439-15-1 \$59.95

FORTH-64 - loaded with hires graphics, complete synthesizer control, full screen editor, programming tools, assembler.
ISBN 0-916439-32-1 \$39.95

C LANGUAGE COMPILER - a full C language compiler. Conforms to the Kernighan & Ritchie standard, but without bit fields. Package includes editor, compiler and linker.
ISBN# 0-916439-28-3 \$79.95

ASSEMBLER MONITOR-64 - a macro assembler and extended monitor package. Assembler supports floating point constants. Monitor supports bank switching, quick trace, single step, more.
ISBN# 0-916439-11-9 \$39.95

XREF-64 - indispensable tool for BASIC programmer cross-references all references to variable and line numbers.
ISBN# 0-916439-27-5 \$17.95

tronic Arts games, which the MSD does not.

An additional \$29 will buy a fast-loading cartridge with copy routines, BASIC 4.0, and a DOS wedge.

World Disk Drive, 23501 Ridge Route Drive, Bldg. D, Laguna Hills, CA 92653 (phone: 714-855-1761).

OFF THE HOOK

A postscript to last month's *Ship to Shore*, wherein Cheryl Peterson reported on the plight of Tom Tcimpidis, Los Angeles-based SYSOP

facing persecution for telephone fraud over the appearance of an AT&T credit card number on his BBS: the city attorney's office has dropped the case due to lack of sufficient evidence to prove that Mr. Tcimpidis knew the number had been posted.

It was stressed that the decision to drop the case did not reflect any unwillingness to prosecute future SYSOPs whose boards post illegal messages.

RESET SWITCH

If you don't care to try any of the methods suggested in this issue by Tom Benford and Morton Kevelson to *Install a Reset Switch on your VIC or 64* (see page 13), you can take the easy way out and purchase Master Software's new Reset Master.

The switch, which plugs into any serial port on your system, will reset your C-64 or VIC 20 without shutting off the power, and restore con-

Make Your Home Secure and Energywise ...with Genesis Home Control Products

At Genesis Computer we produce a complete line of home security and energy management products. They combine with your Commodore 64 to make your home safer and more energy efficient while increasing your personal convenience.

The Genesis VController allows you to control up to 256 lights and appliances throughout your home using standard BSR receiver modules. With the included software, you can create daily and weekly control schedules.

Your system can be expanded by adding Genesis' COMsense input device, Super Schedule Plus software, and available sensors. Commands can then be issued in response to on/off inputs such as the opening of a door or analog inputs such as a change in light level. By adding COMclock, a crystal controlled clock/calendar, your system will have an accurate, battery backed-up time base. COMclock's Autoboot ROM acts as a failsafe restart for the system in the event of a power failure.

Sold separately the VController, COMsense and COMclock sell for \$69.95 each and the Super Schedule Plus software sells for \$19.95. All four products are available together in our HOME CONTROL PACKAGE for only \$199.95.

Call 215-861-0850 to order direct or contact your local dealer.

Genesis Computer Corp. • P.O. Box 152 • Hellertown, PA 18055

How to INSTALL A RESET SWITCH ON YOUR VIC OR 64

By Tom Benford
Photos by Liz Benford

They say that people generally have 20-20 hindsight, and this is true even of the design team at Commodore. The most faithful supporters of the Commodore 64 must admit that there are a few areas in which their computer is lacking. One example is the absence of a reset, or "warm boot," switch. On the Plus/4 and C-16 computers, Commodore provides this switch as standard equipment, having learned a thing or two from the C-64 and VIC. What I'm presenting here is an inexpensive, simple way to add on one of these handy gizmos to your present Commodore computer. Since we'll be hooking it up to the user port, the same instructions and connections apply to either the VIC 20 or C-64, which have identical user ports.

What does a reset switch do? It performs almost the same way the power (on-off) switch of your computer does, with a couple of major benefits. One of these is clearing the screen and memory while not interrupting power to the rest of the computer; it allows you to reinitialize the system without having to turn the C-64 off and then back on again. There are many, many uses for such a switch, among which are restarting a game or utility cartridge, or more practical applications such as regaining control of your computer without having to turn it off and then on again. The possible applications of a reset switch for specific programs (both commercial and of your own device) are numerous; in fact, there are literally thousands of uses for this "warm start" (also called "warm boot") capability, and your imagination is the only limit on what you'll use it for.

While this is a perfectly safe and simple modification, it *will* void your warranty, if still in effect. Also note that neither I nor *Ahoy!* can assume any responsibility for damage to your computer by performing this modification on it. If you have any reservations about your soldering sapience, it may be a good idea for you to give this article and your computer to a friend or technician who can complete the project for you.

Construction is fairly simple, with only a basic knowledge of soldering techniques required. The bill of materials is equally minor, and the whole project should take well under one half hour to complete. Let me mention first that the switch we'll be using is a standard Radio Shack item that comes five to a package. You'll only need one switch for this project, so you may want to give the others to friends or members of your user's group. Or, you may want to keep the extras for possible use on future projects we'll be covering: the choice is yours. Now, let's get our shopping and tool lists together!

Parts List (Figure 1):

1 package (5) Miniature Push Button Switches—Momentary SPST Contacts, Normally Open (Radio Shack #275-1547)—\$2.49

Approximately 3 feet light single conductor wire (30-gauge AWG wire-wrap wire is ideal)—\$.50

Tools Needed (Figure 1):

Medium-heat (30-50 watt) soldering iron

Rosin-core electronics solder

Wire strippers/pliers

Phillips screwdriver

Electric drill with $\frac{3}{8}$ " bit

Towel

Figure 1

Figure 5

Figure 6

Figure 7

Figure 8

5. Drilling hole for switch in top cover of C-64. **6.** Tinning the wire ends. **7.** Soldering wires to the user port—pins #1 (ground) and #3 (reset) are the ones we're using. Solder as close to the inside of the circuit board as possible. **8.** Soldering wire ends to switch terminals.

CONSTRUCTION

Find a clean, well-lit area to work on, spread out the towel, and invert your C-64 on it (the towel will prevent you from marring or scratching the computer). Make sure that *everything* is disconnected from the C-64:

power, serial, monitor, cartridge, and user ports should all be empty. Remove the three Phillips-head screws that join the two case halves together, and put these screws somewhere safe for the time being (figure 2). Turn the computer right-side up and *gently* separate the two halves. You'll notice that there are wires connecting the top to the bottom half. These are the LED indicator at the lower right of the circuit board and the keyboard harness at the left side; both of these wires packages use slide-on connectors. Pull gently on the connectors themselves to remove them from the circuit board (figure 3). You should now be able to fully remove the top half of the computer; do this and set it aside for the moment.

Late model C-64s have a paper/foil shield to cut down on TV and radio interference. If yours has this shield, lift the copper foil tape from it and peel it back (figure 4). Once this is done, you'll be able to fold the interference shield forward, thus exposing the heart and soul of the computer—the actual circuit board itself.

To the upper left you'll see the contacts of the user port—we'll be making our solder connections to contacts #1 and #3 (see diagram #1, courtesy of the C-64 owner's manual).

Plug in your soldering iron to get it up to working temperature. While the iron is heating up, we can proceed to drilling the hole for the switch.

Placement of the switch is largely a matter of choice, but I recommend putting it right next to the power indicator LED; it gives a more "professional" appearance, as well as keeping it out of harm's way. Using a $\frac{3}{8}$ " bit, drill a hole through the top of the computer keyboard about $\frac{3}{4}$ " away from the LED (figure 5). Clean any remnants of drilled plastic from both the outside and inside areas of the keyboard. Remove the nut from the switch and give it a test-fit to make sure it fits in the hole easily (you may have to ream the hole slightly for a comfortable fit).

Figure 9

Figure 10

Figure 11

Figure 12

9. Completed connections to user port pins #1 & #3. **10.** Completed connections to switch, with wiring tucked under shield. **11.** Just prior to closing: keyboard & LED harnesses back in place, switch mounted on top cover, wiring tucked away. **12.** Completed installation. Looks factory-perfect!

Your soldering iron should be up to working temperature now. Cut your hookup wire into two 16" lengths, and strip about $\frac{1}{4}$ " of insulation from both ends of both pieces. When this is done, "tin" all four wire ends with a small amount of sol-

HOW TO AVOID BECOMING A DINOSAUR.

If dinosaurs had kept up with their rapidly changing world, you might have a pet bronto today. (It's probably just as well they didn't, since they wouldn't fit into a small imported car anyway.)

The point is, if you don't want to get left behind today, you need a computer with the latest software and accessories. No question about it.

The only question is, "where do I buy it?"

Ah! We thought you'd never ask. Computer Warehouse, of course. Nice guys, great prices. Give us a call today. We'll get your shipment out bronto—er, pronto.

der. This is done by melting solder onto the wire ends; not too much, though—just enough to coat the wire ends with solder (figure 6).

Refer again to the diagram of the user port. With the circuit board facing you, the #1 contact is the one on the extreme right, and #3 is the third one from the right. Solder one end of each wire to each of these contacts; but make sure that you solder them as close to the circuit board as possible. The reason for this is so that the solder/wire won't interfere with the contacts of the port when using a modem or other peripheral. Since you've tinned the wire ends, only a small amount of heat should be necessary to complete the connections (figure 7).

When these connections are completed, take the remaining two wire ends and solder each of them to opposite terminals on the switch (figure 8)—the order doesn't matter on these. The completed connections should look like those in figures 9 and 10.

64 or VIC user port, plus descriptions of pinouts for input/output devices (see C-64 User's Guide, p. 142).

Assuming everything's gone smoothly so far, you should now be ready for reassembly. Insert the switch into the hole in the top cover, secure it with the nut, and tighten it up. You won't need the washer, so discard it now.

Place the top half over the bottom half, fold the interference shield back to cover the board, reattach the copper foil tape to the shield, and plug in the two harness connectors. These connectors are "keyed" so they'll only go on the right way. Don't force them on! When the connectors are positioned over the pins correctly, they should slide right on with very little effort (figure 11). When you've got them in place, close the two halves of the computer.

Now invert the computer, replace the three screws, and tighten them to finish the job. That's it!

The finished job should look like figure 12. The switch looks like it grew there, doesn't it? Plug the power cable back in, as well as the other cables, and you're ready to roll. □

How Many Ways Can I Reset Thee? Let Me Count the Ways.

By Morton Kevelson

I've always been reluctant to perform surgery where it shows on a finished commercial product. This probably stems from an initial conservatism against violating the sanctity of the manufacturer's warranty, or perhaps a misguided urge to preserve the resale value for as long as possible. Whatever the reason, I surmise that many users share this reluctance with me. It thus seems fitting to present a number of ways by which you can add a reset button to the Commodore 64 or the VIC 20 without opening the computer.

If you carefully examine the pin-

out drawings on pages 142 and 143 of the manual supplied with the Commodore 64 (pages 150 to 152 for the VIC 20) you will notice that the reset line is available at the user port, the serial port, and the cartridge port. In fact, the corresponding pins of each of these ports are electrically identical due to a direct connection inside the computer. A reset switch may be connected between ground and the proper pin at any one of these ports.

THE USER PORT

In the user port, as we have pointed out, the reset line is on pin

three. If you simply connect a push-button switch between this and ground on pin one the job will be complete. Figure 1 illustrates how to use a 24 pin edge card connector with the pins on .156 inch centers. Properly done, the pin spacing allows the switch to be self mounting. Total cost is about \$2.50 for switch and connector. You may want to cover the exposed pins with some insulating tape to prevent electrical shorts due to contact with foreign objects. The proper pins can be easily located by simply orienting the connector as shown in the manual. The pin identification should be molded in the

connector housing, making the job even simpler. Remember, all of the pinouts in the Commodore manuals are as viewed from looking at the back of the computer.

THE SERIAL PORT

The serial port has the reset line on pin six with ground on pin two. If you do not have a disk drive or printer you can actually mount a switch on a six pin DIN connector and install it at the serial port. Public Domain, Inc. (5025 S. Rangeline Rd., West Milton, OH 45383—phone 513-698-5638) offers a completed assembly for just \$5. If you have a disk drive, the second port on the 1541 can be used just as easily. If you also have a printer, there is still a way to add a reset switch to this port, although the method is somewhat crude. It will require some minor surgery of the disk drive connecting cable. Carefully slit the insulating cover and remove some of the copper braid which shields the inner conductors. In the case of the cables supplied by Commodore, the wires you want are colored purple and blue. Other manufacturer's cables may have different color code schemes. Simply connect the terminals of the switch directly across the wires. Be careful to maintain continuity of the existing circuit. Figure 2 shows a partially completed job. To finish things off, just wrap the exposed connections with insulating tape.

THE EXPANSION PORT

The cartridge port offers a unique opportunity for adding a reset button. Just find a suitable cartridge, which you intend to leave in place all the time, and install the switch. The Epyx Fast Load cartridge (reviewed in this issue) is a particularly good choice. If you do a soft reset by entering SYS 64738, the Fast Load cartridge is disconnected. If you hit the reset button, the cartridge is reconnected. Figures 3 and 4 show the installation. Of course, you will have to carve up the cartridge somewhat, but cartridges are much cheap-

er than computers. Some cartridges (such as Fast Load) are held together by a screw hidden under the label. If you feel around the top it will be easy to locate.

PUSHING THE BUTTON

Interestingly enough, when you push the button everything grinds to a halt. It is when you let go that things take off. All the major chips in the C-64, with the exception of the VIC-II chip, are reinitialized. When the button is released, the microprocessor starts executing the code whose starting address is stored in 65532 and 65533 (\$FFFC and \$FFFD). (For a more detailed discussion refer to the *Exposé of the VIC & 64 Operating System* in the January '85 *Ahoy!*) Just remember that all serial bus peripherals will also be reset by the reset button. It would be a good idea to remove any disks from the drives before initiating a hardware reset.

ON SEMANTICS

The term "Warm Boot" generally refers to a partial reset of a system without turning the machine off and then on. The term "Cold Boot" refers to the startup procedure the computer follows immediately after power on. The reset button discussed in these articles actually has the effect of making the computer go through the initial power on sequence. Thus, some may argue that the switch be called a "Cold Boot" switch, and the term "Warm Boot" reserved for the SYS mentioned above. Others go so far as to argue that even the SYS command should be referred to as a "Cold Boot." We prefer to avoid the whole issue by simply referring to the reset switch as a "Hardware Reset" and the SYS command as a "Software Reset," leaving all temperature considerations to the budding meteorologists in our audience.

Alert readers may have noticed that the word reset in the Commodore manuals is printed with a line above it. This is simply the logical negation symbol. Purists may read this as "not reset." It means that the

Figure 1

Figure 2

Figure 4

1. User port reset: note position of contacts 1 & 3 at left end of top row. 2. Reset switch installed on serial port cable (top) & user port connector (bottom). 3. Internal connection of switch in Fast Load cartridge. 4. Completed assembly.

reset action takes place when this line is a logical 0, or in our case by pulling the five volts normally on this line to ground or 0 volts.

As with all construction projects presented in *Ahoy!*, the user assumes all responsibility for any catastrophes which may result from self-inflicted tinkering. □

CREATING YOUR OWN GAMES ON THE VIC AND 64

Recently I was at a party where a lot of science fiction and fantasy writers and readers were gathered. I have no shame—I look at such events as therapy for my ego and I milk them for everything they're worth.

I was told that one of the guests was Walter Meyers, a professor at North Carolina State who happens to be on the panel that gives out the Campbell Memorial Award for the best science fiction novel of the year.

Now, we writers, sophisticated and worldly as we are, all pretend that awards mean nothing to us. But all the time we're saying that, we're swallowing hard to keep from drooling at the thought of getting one.

So I was prepared to discuss, modestly, the significance of my contribution to science fiction and fantasy literature.

Instead, he handed me a disk. "I've been reading your column in *Ahoy!*," he said. "I wondered if you'd look at these games." He mentioned that he had created some really dazzling sound and graphics. And when I got the disk home, darned if he hadn't.

The disk contained several games, but they were all linked with a menu program. The menu began with some messages in nice large characters. Then we were given a musical interlude in Digit's Music Hall. A curtain opened to reveal a beautiful pipe organ. A penguin walked on, sat up to the organ, and played some Bach. The penguin's fingers moved properly on the keyboard; the music was flawless. The curtain went down, and then came back up to reveal the message: "And now, the menu."

Whereupon the letter M walked out to the middle of the screen and beckoned to the other letters. E slithered on, N was a bit more dainty, and U positively wafted. Then, underneath it, five games were offered:

A find-the-letter-on-the-keyboard game, in which nestling birds squawk until their letter is struck.

An abstract GO-like board game, in which players take turns moving tiles and flipping colors.

A duel with swords, in which you select the moves to make against opponents with varying levels of skill.

A memory building (or, in my case, ego-destroying) game in which you try to remember how many Moes, Larrys, and Curlys you saw while a single match was lit.

And the *piece de resistance*, a truly magnificent flags-of-the-nations game.

And my job was to play them like an idiot.

GET HELP FROM AN IDIOT SAVANT

You see, once you've programmed your game and it's doing everything you want it to, it's time to have it tested

What you get if you cross a Commodore 64 with a Ferrari.

You get the incredible
Indus GT™ disk drive.

You get brains. You get beauty.
But, that's not all you get.

You get a disk drive that can
handle 100% of Commodore's
software. Up to 400% faster.

You get the disk drive with the
best service record around. With
a one year warranty on parts and
labor to prove it.

And, you get the only disk drive
that comes with free software.
Word processing. Spreadsheet.
Database manager. Plus, a carry-
ing case that doubles as an 80
disk storage file.

Most of all, you get luxury.
From the sleek lines of its sound-
proofed chassis to the respon-
sive AccuTouch™ controls at the
Indus CommandPost™. From the

LED display that keeps you in
control of your Commodore to
the air-piston operated dust
cover that protects your disks
and drive.

So, you know what you really
get if you cross a
Commodore 64
with a Ferrari?
You get the
best.

INDUS™

by somebody else. Somebody who doesn't know anything about the game. Preferably, somebody who will quickly do everything that you didn't think anybody would be dumb enough to try.

We're talking about genuine creative stupidity.

For instance, in the middle of *Got a Match*, I decided I had better go back to the preschool game, which was better suited to my mental abilities. I tried to quit prematurely. Apparently Walter Meyers hadn't counted on anybody giving up in frustration. There was no orderly exit—at least, when I pressed Q the game didn't Quit, and none of the function keys stopped it, either. Nor did the RESTORE key—but it *did* wreck the display.

What kind of idiot would press the RESTORE key during the game?

Now, Walter Meyers didn't make a mistake, I did. But if I had plunked down forty bucks for the game, I wouldn't be rational about something like this. I wouldn't say, "Card, you idiot, why did you press the RESTORE key?" I'd say, "What kind of game is this that the only way you can quit early is to turn off the machine?"

And I'm not only stupid, I'm lazy. I didn't want to have to find the numbers 1 through 5 on the keyboard to choose my guess for the nation whose flag was displayed. I wanted to be able to move a cursor up and down and have the computer highlight the choice I'd made. Then I'd never have to look down at the keyboard at all.

There were times I wanted to do things the game didn't allow. Times I didn't want to do things the game required. I am reporting all those things to Walter Meyers.

Will he act on them all? Maybe. And maybe he'll look at me with pity and wonder how a guy this dumb ever got to write a column for a national computer magazine.

Hear me, O game designers. Treasure your stupid friends. If you have no stupid friends, find some. Because the idiots who do everything wrong when they're testing your game are the biggest help you'll ever get.

By the time you're through making it so they can do all the things they wanted to—and can't do any of the things they wish they hadn't—you'll have a game that is perfectly polished.

You could never make that many mistakes on your own. You just can't do it without the help of us dolts.

SELECTING OPTIONS

Most games use Option Selection at some time during the game. It can be as simple as the One-Player/Two-Player option at the beginning, which is never used again until the game is over; or it can be the heart of the game.

For instance, Walter Meyers' game *Flags* depended entirely on option selection. Each time a new flag was displayed, the names of five nations appeared under the flag, numbered 1 to 5. To select one, you just press a number.

Things got more complex with *Flashing Swords*. Here, there were many options, like Thrust, Parry, Rest, Feint, and so forth. Sometimes a modified set of options ap-

peared, adding Lunge and leaving off some of the others. Now to choose an option you press the appropriate key: L for Lunge, T for Thrust, and so on.

The same thing cropped up in an early version of a trivia game sent to me by Jan Iverson. Possible answers were numbered.

Now, this single-keypress method of option selection is a vast improvement over using INPUT statements to read whole words. For instance, an early game for the Atari was *States and Capitols*. Instead of offering a menu, you had to type in the name of the state. Now, for a touch typist who is a fanatic about correct spelling—like me—that posed no problem. But when my then-four-year-old son played the game, he *hated* typing in all those letters.

What if he spelled Tennessee with only one N? He knew the name of the state—he just didn't know how to spell it. So the game wasn't really a geography teacher—it was a spelling exam.

Worse yet, the programmer tried to "simplify" things by using only the first five letters of the state's or capitol's name in the recognition loop. This meant that the word Washiplvxzyut was as "correct" as Washington. It also meant that if you wrote North Carolina when the state was North Dakota, the program thought you were correct. Great educational program!

So the multiple choice technique, where you are shown several options and allowed to choose by pressing a single key, is a great improvement over requiring the player to type whole words.

But it still has drawbacks. In numbered menus, where you choose option 4 by pressing the 4 key, there is no necessary relationship between the answer and what you press. If the answer you want is number 4, you have to look on the screen to see what number it is, then look down to the keyboard to find the number, and then look back to the screen to see how you did. And don't kid yourself that touch typists don't have to do this. There are an awful lot of us hundred-word-per-minute typists who still stop and look for numbers and symbols on the top row. That's terra incognita up there.

The first-letter option solves part of the problem—T for Thrust means you only have to think of the word Thrust and you know what to press. But it makes things even worse for hunt-and-peck typists. We touch typists know without thinking where T is on the keyboard—but a lot of your players won't know.

There *is* an easier way.

Just put your menu of choices on the screen. Not numbered, but each in its own position on the screen. All the options are printed in letters of the same color—except one. That one is in a much brighter color. It is the current selection.

Then you merely move the joystick up or down. The former current selection returns to the regular color, and the one just above or below it is changed to the highlight color.

You can keep moving from choice to choice, until you

reach the one you want. Then you press the button. You have made your choice. (It works the same way with the keyboard. You use the f5 and f7 keys to move up and down, and the space bar to select.)

Why is this better? Because you want to have as few barriers as possible between the data and the decision and between the decision and the action. In this case, players don't have to figure out which number or letter represents their choice. Their choice is highlighted on the screen. And to change from one choice to another, they don't have to find a particular key on the keyboard. They only have to remember *up*, *down*, and *action*.

These games were good games even with the relatively clumsy control system. But that's what you do when your game is finally working—you fine tune it, change it here, change it there, to make it simpler to play, and yet more fun, more fascinating, more satisfying.

HIGHLIGHTING WITH PRINT

Now that I've described how highlighting with a menu of options is the best way to handle multiple choice games, it's only fair that I show you how it's done.

The screen display is simple. You just put the choices in a column. Let's say we're playing "Ambassador," and you have to negotiate with the minister of state of Lotharingia. Your king has instructed you to engage Lotharingia in an alliance against powerful Bavaria. In the game, you are given bits of information to help your preparation—those appear at the bottom of the screen. Your instructions from the king appear at the top of the screen. And in the middle are your options:

- Give gifts
- Make threats
- Offer concessions
- Maneuver
- Stall
- Leave

Each choice leads to a sub-menu, which appears when you have made your choice. For instance, if you choose to Offer Concessions, the sub-menu lets you choose which concession to make:

- Trivial concessions
- Lower tariffs
- Free trade
- Loans
- Economic aid
- Passive military aid
- Active defensive aid
- Active offensive aid

Once you have selected from the sub-menu, the opponent (or computer) responds, and you prepare your next move. After a certain amount of time, the computer judges how well you accomplished your objective, and the next round begins.

There are several ways to program the highlighting of options. You could keep every option in a string array, and PRINT the highlighted option each time in a different color. For instance, let's say that the six ele-

ments in the initial menu are held in the array `OP$(n)`. There are two colors, `C1$` and `C2$`. `C1$` is white, and `C2$` is light blue—the normal color for letters on the screen.

To put the initial menu on the screen, you would get the cursor to the beginning of the option menu and use:

```
FOR I=0 TO 5:PRINT C2$OP$(I):NEXT
```

Then, to highlight option 0, the first option, you would get the cursor to the right row and use:

```
PRINT C1$OP$(0)
```

Now option 0 appears in white.

When the player moved the joystick down to the next row, you would first get the cursor to the position of the old choice, option 0, and

```
PRINT C2$OP$(0)
```

That sets the first option back to the regular background color.

Then, get the cursor to the position of the new choice, option 1, and

```
PRINT C1$OP$(1)
```

Now the second option, option 1, appears in white.

This system would work just fine, except that for multiple menus you'd have to set up two-element arrays, with one element to choose the menu and another to choose the option.

But there's a simpler (though not always faster) way, based on the way the Commodore 64 and VIC 20 handle foreground color.

HIGHLIGHTING WITH COLOR MEMORY

As you know, the screen is mapped in "screen memory," a portion of memory in which each byte corresponds with one position on the screen. The bytes of memory contain the code number for the particular character to be displayed in that particular position on the screen. (These are not ASCII codes—they are the screen display codes.)

The first address in screen memory contains the code for the character that will appear in the upper left-hand corner of the screen. The second address in screen memory contains the code for the character that will appear just to the right of it. The 22nd address (on the VIC) or 40th address (on the 64) contain the code for the rightmost character on the top line. The next address has the code for the leftmost character on the next line down. And, of course, the last address in screen memory contains the code for the character in the lower right-hand corner of the screen.

When you use PRINT statements, BASIC takes the

A Disk Display and Update Utility for the C-64 and VIC 20*

***5K Memory Expansion Required**

By Mark Johansen

Not long ago I had some hardware problems with my 1541 disk drive and, before I realized what was causing my difficulties, the directory on a rather valuable floppy was destroyed. I took the drive to the shop and it was duly repaired, but in the meantime a disk was rendered useless. There is probably a corollary to Murphy's Law that states that when such a thing happens, the floppy disk destroyed will always be the only one you own that you neglected to back up, for that is exactly what happened to me. But I knew that most of the data on the floppy should be intact: it was only the directory and perhaps one or two files that were damaged. If only I could repair the directory, the effort that went into writing several good programs could be saved.

The problems involved in such an effort could be divided into two parts: one, I had to have a way to directly modify the directory; and two, I had to know what I should modify it to be.

To solve the first problem I wrote a disk display and update utility, which I call *DSKDU*, and which I shall endeavor to describe here. It allows the user to look at what is on any given sector on the disk and modify it if he so chooses, while bypassing all the standard file processing routines. It requires a C-64 or a VIC 20 with about 5K expansion and, of course, a 1541 disk drive.

The second problem was made much easier than it might have been by the fact that Commodore provides fairly good documentation in the *1541 Disk Drive User's Guide* on how they laid out their disks.

The results of this effort have proved to be useful in situations beyond the original problem. For example, I have occasionally managed to create files with illegal names such as ",", which cannot be deleted with the *Scratch* command, but which can be killed off with *DSKDU*. On the other hand, it makes it rather easy to "un-delete" files that I have accidentally scratched (provided I get to them before the system has reused the disk

space). It has allowed me to look at exactly how various types of files are stored, and I have even used it a few times to create data files that would have been inconvenient to produce with BASIC.

FLOPPY FORMAT

If you hope to accomplish anything useful by directly modifying disk data, you must have some idea of what the results should look like. Commodore conveniently provides details of their disk storage layouts in the *1541 Disk Drive User's Guide*, pages 65-68. I see no need to repeat all the details here, but the manual is extremely terse and some explanation may help you to understand what the tables are all about.

The disk is divided into 35 tracks, numbered from 1 on the outside to 35 nearest the center. Each track is divided into sectors, which are numbered from 0 to 20, but not all tracks have the full 21 sectors—the number of sectors per track decreases as one nears the center of the disk. (The table on the top of page 65 in your *User's Guide* gives the actual number of sectors on each track.) Note that for some mysterious reason Commodore chose to number tracks beginning with one but sectors beginning with zero.

The system maintains a directory on each floppy in which it records what files are on this floppy along with certain information about them. The directory always begins certain information about them. The directory always begins on track 18, sector 1. Each file has one entry in this directory. The first entry begins on the third byte of the block and each entry is 30 bytes long with two byte gaps between them.

The first byte of each directory entry contains a code indicating whether this file is sequential, program, relative, or "user". If this byte is "00" then the entry is not currently in use; it is either beyond the largest number of files you have ever had on the floppy or the file has been deleted. In this case any other information in the

entry is irrelevant.

The most obvious piece of data is the file name. This is easy to see because it is stored as normal ASCII text. The primary function of the directory is to relate this name to the actual data on the disk, which it does by also keeping the track and sector numbers of the first block of the file.

In this first block, the first two bytes contain the track and sector numbers of the second block. The remaining 254 bytes contain the beginning of the actual data making up the file. The first two bytes of the second block contain the track and sector numbers of the third block, which contains the track and sector numbers of the fourth block, and so on, forming a kind of chain. The "pointer" in the last block has a track number of zero. (Remember that "real" track numbers begin with one.) Instead of a sector number, the second byte will contain the number of bytes in this block which actually form part of the file. This allows the system to determine exactly where the file ends; without such an indication all files would have to come in exact multiple of 254 bytes.

The directory itself is chained together just like a file. The first two bytes of its first block contain the track and sector numbers of its second block, which points to its third block, and so on. It wouldn't do if we had to look in the directory to find the directory, so instead it simply always begins at track 18 sector 1. By the way, this location was presumably chosen because it is in the

exact center of the disk, and as the directory will normally be referenced more than any other data this should minimize movement of the read/write heads and therefore of disk delays.

This system of chaining works fine for sequential (and program) files, but relative files are intended to be accessed randomly; that is, we do not want to have to read through all preceding records in order to find the one record desired. To enable us to do this, Commodore employs what they call "side sectors." The directory entry for a relative file contains a track-sector pointer to the first side sector in addition to the pointer for the first data block. The first two bytes of this first side sector block point to the second side sector, which contains a pointer to the third, and so on in the now-familiar pattern. Each side sector contains pointers to up to 120 data blocks. Thus, when a program asks for a record, the system will first determine which block it is in by comparing the record length to the standard 254 data-bytes per block. If it turned out to be in, say, block 67, the system would then find the 67th pointer in the first side sector block and retrieve that block directly, without having to follow the chain all the way from the first data block. Similarly, if the record turned out to be in block 700, the system would find the 100th pointer in the sixth side sector block. Now, the whole purpose here is to avoid having to follow the pointers to find the desired block, so we really don't want to have to follow pointers to get to the needed side sector. Instead, each side sector contains pointers to all of the other side sectors. The system will always keep the last one used in memory, so even if it doesn't need the same one again at least it will know where the one it needs is to be found. Each file is limited to a maximum of six side sectors, but as each can point to 120 data blocks, this allows for a total of 720 blocks, more than are actually on a disk.

The format of user files is completely determined by the programmer, so they do not necessarily follow any of the above rules. If you wish to use them, you're on your own.

USING DSKDU

The operation of the program is intended to be straightforward. One general point should be made before I describe the individual functions. All numbers are displayed in hexadecimal, and all input must also be in hex. While this may seem inconvenient at times, most notably when entering track and sector numbers, the disk data itself is usually most logically presented in hex, and as you often get the next track/sector from the data in the current one, it seemed reasonable and consistent to make all input and output be in hex.

Once it is LOADED and RUN, the program ask for the first track and sector to be displayed. (Remember these numbers must be entered in hex.) The program will read the disk and display the first sixty-four bytes of that block on the screen. At the extreme left of each line will be the offset into the block, followed by the

An open letter to the readers of Ahoy Magazine Vincent Kurek President: The Ennon Corporation

My purpose in writing is to ask you to join me in shaping the future of the new and most unusual field in computer technology today: Artificial Intelligence.

This incredible power and spectacular creative potential are available to you, for your computer right now. However, there is an alarming possibility that such amazing technology which you have every right to, may not be available to you other than through this offer.

This is unfortunate but somewhat understandable due to the way technology is created. You see, only the business oriented corporation can finance research. It therefore is in a position to dictate immediate research goals. These goals are increasing profits through more efficient production. While valid, they are merely creative and do absolutely nothing to foster exploration in new applications. The result: technology is never used to its fullest potential. But what's worst of all is that these competitive corporations have absolutely no desire to share technology with each other, let alone with you. So, they don't. As a result, the infinitesimal amount of technology that finally trickles down to you is:

- A. So expensive you are prohibited from procuring it
- B. Shamefully inferior to the real thing

remember...you can buy high-tech consumer goods, but never the technology that creates it.

This same situation confronts you in the new Artificial Intelligence field, but with a difference: There is no true Artificial Intelligence for the home computer user! The few programs claiming to be Artificial Intelligence are really simulators. They are not the real thing. Possessing a mere token of the power and versatility, simulators are clearly not worth their expensive price.

I have tried repeatedly to convince my colleagues that it is in their best interest to release genuine Artificial Intelligence to the general public. The refinement, modification and adaptation as individuals create new applications would improve Artificial Intelligence tremendously. This would benefit everyone in the long run.

I have met with little success. Apparently, it seems that immediate corporate profit is more important than sharing technology with the public. Therefore, the Ennon Corporation stands alone in offering superior Artificial Intelligence programming directly to the home computer enthusiast.

Announcing AN-83: The "Thinking" Program

Believe me when I say AN-83 is the real thing. It is a true "thinking" program that receives an initial "knowledge base" from a data file read when AN-83 is started. Using inductive and deductive logical analysis, this amazing program deduces everything from that data and adds it to its memory. Conversing with you, AN-83 adds and combines with facts already known. It generates new conclusions not explicitly contained in its original knowledge base—just like your own thinking process! The result: it knows considerably more than the specific facts given to it.

AN-83 can also think about anything. It is virtually unlimited in its application. Think of your possibilities. The potential is limitless. In the right hands, AN-83 would revolutionize the adventure, strategy and other smart game-playing programs to say nothing of classic arcade games. On the other hand, AN-83 could be one of the most powerful business analysts available to the home computer.

FREE SOFTWARE

In addition, you will be receiving free, Eliza—the most amazing conversational A.I. program to date. Run this for your friends and jaws will drop with amazement. Eliza's responses are so human, it's uncanny. An entertaining program, Eliza will answer once and for all the question: What can your computer do?

How to Learn Artificial Intelligence

You can be creative. Experiment and modify to fit your personal use because AN-83 and Eliza both possess source code in basic, the most popular easy to use language for the micro. Their extensive, easy to understand commands walk you through the source code

step by step. It's surprisingly simple. Even the beginner can understand the "How and Why of A.I."

A Fantastic Savings

The real profit to Ennon Corporation will be your participation in the future of Artificial Intelligence. Therefore, I am pleased to say nobody will miss this chance because they could not afford it. AN-83 is priced to cover just a fraction of its research and developmental costs.

The "Thinking" Program AN-83 is just \$21.57. What's more, the astounding Eliza is yours absolutely free.

I guess it's obvious that I want you to participate in the future of Artificial Intelligence. Forgive my excitement and enthusiasm but I just know you are going to be very happy and impressed that such things could be done with your computer. You just won't believe it. Please take this opportunity now. Simply fill out your coupon below and mail today. Don't miss out. It's such a wonderful future of discovery and excitement that awaits you.

With very best of wishes,

Vincent Kurek

- ☐ Please send me the "Thinking" Program AN-83 for only \$21.57. In addition, I will receive absolutely FREE Eliza—the most impressive conversational Artificial Intelligence program to date.

Available in disk only.
For use with the Commodore 64.

Commodore is a registered trademark.

values of the data bytes in hex, and then their representations as ASCII characters. Any byte which is not ASCII for a letter, digit, or one of a few special characters will instead be displayed as a period.

Due to the limitations of the VIC's screen size, the program can only display 64 bytes of each 256 byte sector at one time. To get the next 64 bytes you must press the f3 key. If you wish to go back to the preceding 64 bytes you must hit the f1 key. If you hit f3 while the screen is displaying the last 'page' of the block you will be shown the first page, and if you hit f1 while the screen is displaying the first page you will be shown the last page.

When you are finished looking at a given sector, you may instruct the program to show you another sector by pressing the f7 key. It will then ask you for the track and sector numbers and proceed as above. If you press the f4 key instead the program will dispense with asking you for a track and sector and will display the next block in the file.

If you wish to modify a sector, you may use the cursor control keys to move to the hex digit of the byte you wish to change, then press any valid hex digit key (0 to 9 or A to F). The ASCII on the right will also be changed to reflect the new value. You may change any number of bytes in a sector and freely flip pages with the f1 and f3 while doing so. When you have the sector looking the way you want it, press f8 to actually update the disk. Until you do this your changes are only kept in RAM, so if you make a mistake and want to get back to what was in the sector before, you need only press f7 and reread the same sector (or you could go on to some other sector and forget the whole thing).

When you are through monkeying around with your floppy, press f2 to exit the program. Note: Don't exit by pressing RUN/STOP as this will leave the disk channels open and terrible things may result.

If you press any key which the program cannot interpret, it will flash a help screen telling what the valid keys are and what they do. If you forget which function key does what, simply hit anything invalid, such as the return key or a question mark, and you will be shown this help screen.

PROGRAMMING NOTES

A few comments may be in order on some of the less comprehensible portions of this program.

The first requirement in writing it was to be able to get data off the disk by track and sector and then put it back after it was modified. This could have been difficult to do had not Commodore conveniently provided the U1 and U2 disk commands. The U1 command causes the drive to read a block specified by a track and sector number and load it into a buffer in the drive unit; U2 takes data from the buffer and writes it onto the disk. The only remaining problem was transferring data between the buffer and the computer itself. The normal way to read data is with INPUT# or GET#. INPUT# was ruled out because it makes too many assumptions

about what the data will look like. It drops leading blanks, expects to see a carriage return to terminate the input stream, and assumes each variable will be terminated by a comma or colon. None of this could be expected to be true for an arbitrarily chosen block on the disk, especially for those containing directory information or programs. Thus GET# seemed the logical choice, and indeed that was what I used in my first version of the program. Unfortunately, this ran extremely slowly. Writing with PRINT#, while not as bad, was also unacceptably slow. Therefore, I decided to code the read and write routines in machine language. I have entered the POKE values in the listing with the corresponding assembler mnemonics as REMarks beside them as an aid to comprehension. Each routine transfers data from the buffer directly into or out of the integer array D%. Lines 1130 and 3130 are used to get the address of this array into locations 828-829 where it can be accessed by the ML routines.

Displaying the block is rather simple. Line 2150 prints the hex representations of bytes, four per line, while line 2160 prints the ASCII values. Some of these cannot be printed without messing up the display, most notably the color codes and cursor controls, and so are converted to periods.

Control of the cursor for modification is a bit unusual. Line 2220 computes which byte of the sector we're on from page, line, and column. It also computes an adjusted column number (C1) to allow for the space after every two hex digits on the display. Line 2225 sets up and calls the kernal plot routine. Line 2230 turns on the blinking cursor, and line 2250 shuts it off again after getting a character and then puts back whatever was in that position before (so we don't leave inverse video blocks scattered about the screen).

Whenever a byte is modified, the new value is computed in lines 2430-2450 by simply running the hex representation through the input routine. This is admittedly a bit clumsy, but it was short and easy to write and it seems to run sufficiently fast.

FINAL COMMENTS

Beginning users are cautioned against trying to modify the disk directly when they are not sure exactly what they are doing, especially with regard to the directory. A good idea might be to practice on a 'junk disk' with a few files tossed on it, to see exactly what happens.

Another caution to bear in mind is this: if you do anything to change which sectors are "in use," be sure to run the verify (V command) to update the Block Allocation Map. (This is a table which the system keeps on track 18, sector 0, in which it records which blocks are in use and which are available.) While it is possible to alter the BAM yourself, I definitely recommend against it. Its format is rather obtruse, making it easy to err, and any error can result in data being overwritten—Verify is easier and safer. □

SEE PROGRAM LISTING ON PAGE 105

SUPER DUPER

A Sequential, Program, and Machine Language File Copier for the 64

By Dave Barron

The *Super Duper* file copier utility will allow disk users to copy sequential or program files easily from one disk to another (or onto the same disk). It will also allow you to rename the file. One nice feature is that you can also copy machine language programs without having to know ending and starting addresses, thus making it easy to copy ML programs.

Super Duper demonstrates the use of what I like to describe as hybrid programs. These are programs I enjoy writing because I can take advantage of the easy to use BASIC language and combine it with the speed and/or necessity of using machine depending upon the application. Further, by using kernel routines I can create short effective programs while letting the already built-in ML routines do much of the work.

A brief description of the BASIC program listing follows. Also included on this page is a disassembly of the actual ML code that is POKEd in by the BASIC program, for those that wish to follow the ML logic, with

brief comments. □

Line #s Description

- 10- 30 Clear the screen and POKE in the ML code from the data contained in lines 240 through 280. The numbers POKEd in by line 30 set memory; pointers used for keeping track of where we are in memory later on and initializing a counter location.
- 40- 80 Print onscreen menu.
- 90-110 Get user's choice, convert his string response to a numeric value, and jump to appropriate line to handle choice.
- 120-150 Allow user to input file name.
- 160-180 Open disk file and jump to ML routine beginning at 3584, which reads file into computer's memory.
- 190 Sets where end of file just read in exists, reset memory allocation, and reinitialize counter.
- 200-210 Get user's new filename and allow user to swap disks.
- 220-230 Open disk file to write file to and jump to ML routine at 3621 to write file to disk from computer's memory.
- 230 Tells user copy is complete and goes back to see if he wants to copy any more files.
- 240-280 The data statements with the actual ML code.
- 290 End program.

TWO-COLUMN DIRECTORY

FOR THE C-64

BY RICHARD LOVETT
AND BARRY ARCHER

Have you ever listed a disk directory, only to have half of it scroll out of sight before you could read it? Have you ever wanted to load or erase files right from the directory without typing all those lengthy commands? Then *Two-Column Directory* is for you.

As its name implies, *Two-Column Directory* displays the directory in two rows, making it possible to view 40 file names at once instead of the usual 25 or fewer. (Many of your disks probably contain fewer than 40 files, so much of the time you'll be able to see the full directory in one shot.)

The program also allows you to load or erase files by putting the cursor on the file name of your choice and pressing just one or two keys.

In addition to working as a stand-alone program, *Two-Column Directory* can be pared down to a subroutine for use within your own programs. The subroutine that we will describe omits the load and erase features in order to make the length of the code manageable. The resulting routine will provide a two-column directory from within your program without erasing your program in the process.

In order to display dual rows of directory information, *Two-Column Directory* had to compromise somewhere. The Commodore 64's 40-column screen can't show two file names side by side and still include the program types and number of blocks occupied by each file. So, *Two-Column Directory* displays the program type as one letter (P for Program, S for Sequential, and R for Relative) and omits the file size. Most of the time, the size is not crucial anyway.

After listing the first 40 file names (or fewer, if that's all the disk contains), the program beeps, displays a rectangular yellow cursor, and shows a command line at the bottom of the screen. This line reminds you that f1

will continue the listing, f3 will start the listing over again, f5 loads a program, and f7 erases one.

To load or erase, use the cursor control keys to put the cursor on top of the file name of your choice. *Two-Column Directory* is set up to load any program file that uses the LOAD "filename",8 syntax. If you press f7 to erase, the command line asks you to confirm your intent before it scratches the file. And, if you accidentally put the cursor on a blank line before pressing f5 or f7, the program ends.

Assuming there are more than 40 files on the disk, a press of f1 causes *Two-Column Directory* to erase the lefthand column and show the next 20 file names; if still more remain, another press of f1 erases the righthand column and shows an additional 20. This procedure continues until the full directory has been displayed.

To trim things down to a manageable subroutine, omit lines 70, 140-160, 200, 210, 250, and 260-580. Then make these additions or substitutions:

```
•25 COL=1
•140 IF BY$="" OR BY$=CHR$(34) THEN BY$=CHR$(32)
•165 PRINT BY$;: NEXT
•205 IF COL=2 THEN PRINT HO$+"[DOWN]":GOTO 110
•210 PRINT "[DOWN][12" "][RVSON] PRESS A KEY"
•211 GET J$: IF J$="" THEN 211
•212 PRINT HO$+"[DOWN][DOWN]";
•225 PRINT SP$;SP$;HO$;"[DOWN]": GOTO 110
```

You will also need to add either a RETURN or GOTO line following line 255 in order to send control back to your main program. □

THE PANASONIC KXP 1091 PRINTER

Near letter quality at the flick of a switch

The 1091 zips along at 120 cps and has a 1k buffer. It also has all the print modes of the Gemini 10X and Epson RX-80, plus a BIG difference. The 1091 has a new letter quality switch. Flip it and you get a super tight 12 by 18 matrix with characters that rival a daisy wheel! The 1091 has both friction and tractor feed.

Our price \$279.00

NEW PRINTER FROM STAR!

The SG-10 is an upgrade of the popular Gemini 10X. It runs at 120 CPS, and has all the print modes of the 10X. What makes this printer different is a near letter quality mode at 60 CPS, with a 17 by 11 matrix! With this mode the printer does double duty, eliminating a need for a letter quality printer. It also includes a built in 2k buffer, and a 1 year warranty.

INNOVATIVE ORGANIZERS, INC.

For Commodore 64™ & VIC-20™

WELCOME, to the family of **INNOVATIVE ORGANIZERS**. These **ATTRACTIVE** power organizer stands, made of **ABS PLASTICS, U.L. RATED**, provide an opportunity for a more **PROFESSIONAL** looking computer installation, both at **HOME** and in the **WORK PLACE**.

There is **AMPLE** room under the organizer to place all the computer accessories: **POWER SUPPLY, MODEM, GAME CARTRIDGES, MEMORY EXPANSION**, and **MUCH MORE**.

Now, let's examine how these organizers work. There are 3 CRT-Models.

CRT-1 holds a Monitor or T.V. Set and a VIC 20 or 64. All wires & cartridges fit neatly under the organizer.

CRT-2 same as CRT-1, but also has: **ONE-STEP MASTER SWITCH** (permits 4 pieces of hardware to be turned on and off from one switch, plus circuit protection, incoming power fused with 6AMP Fuse).

CRT-3 same as CRT-2, but also has: **SURGE & SPIKE PROTECTION** built in.

P-D-1: **HOLDS 1525 PRINTER & 1541 DISK DRIVE**. All wires & cartridges fit neatly under the organizer.

Ask about our Power Lock Switch & Power Portable Computer Fan & 2 Outlet Surge & Spike Protection.

Disk Spinners

Replacements and Enhancements for the 1541 Disk Drive

By Morton Kvelson

Last month we examined the Indus GT and Commander II drives, 1541 Physical Exam, and On Track Indicator. This month we conclude with Kwik-Load!, 1541 Flash, and Fast Load.

PART II

KWIK-LOAD!

Datamost Inc.
20660 Nordhoff Street
Chatsworth, CA 91311
Phone: 818-709-1202
Price: \$19.95

While placing the emphasis on fast disk operation, the *Kwik-Load!* name neglects to mention the additional features of this low-cost yet powerful disk utility. Written by Mark Riley, author of *Paint Magic*, the *Kwik-Load!* utility disk contains two programs. The first speeds up the LOAD time of the 1541 with the Commodore 64 by a factor of five. The second is a collection of disk utilities which simplifies and speeds up the most common disk file maintenance operations.

The *Kwik-Load!* utility is a short machine language routine which loads into the \$C000 block in the Commodore 64. It is linked into the C-64 operating system by changing the LOAD vector at \$330-\$331 to point at itself, thus diverting all subsequent LOADs away from the usual Kernal routines. Although a three to one speed benefit is touted by the program's purveyors, the actual benefit is a combined function of the type of disk activity, program length, and number of files being accessed. Typical speed improvements hovered around the five to one mark. For ex-

ample, *Paper Clip*, our perennial favorite for long LOADs, clocked in at less than 15 seconds, down from over a minute and a quarter on the first try. Note that *Kwik-Load!* only works when loading programs. It has no effect on SAVE times.

As with all RAM based speedup utilities, *Kwik-Load!* will perform best with BASIC programs. Most autoboot commercial software will disconnect the program during the boot process. A second version of *Kwik-Load!*, supplied on the disk, LOADs into the top of free BASIC RAM. In the process, it reduces the amount of available memory for BASIC programs by one kilobyte. In exchange, Commodore's DOS wedge can be LOADED in the usual fashion.

KWIK-COPY

Kwik-Copy, the second part of this package, is a comprehensive disk utility program. The highlight of the package is a high speed disk copy routine which will copy an entire disk in 4.5 minutes and three passes with just a single disk drive. If two drives are used, the process takes a mere 3 minutes 40 seconds (of course the need to swap disks back and forth is also eliminated). These times were obtained with the verify option turned off. Turning verify on will slow things down a bit, but not very

READER SERVICE NO. 175

READER SERVICE NO. 176

READER SERVICE NO. 177

much. The routine aborts on encountering a bad sector, so do not wait for those disks to start going bad before backing up.

Kwik-Copy automatically accounts for a second drive. If you have a hardware device nine on one drive, turn them both on and boot the program. If both drives are a device eight, turn one on and boot up. When done, turn on the second drive.

Kwik-Load! will automatically sense the presence of the additional drive and perform a soft change of the device number.

Other utilities included are an easy to use sector editor with a rather nice two part hex and ASCII display, a high speed file copy utility, and a BAM directed copy routine. A drive speed checking routine is included as well. The speed test is completely passive as it does not write to the disk surface when in operation.

The file copy routine has a very handy feature which the manual fails to document properly. When the routine prompts for a file name, enter the asterisk (*) character as a default. The program will automatically display each file name and ask if you wish to copy it.

CONCLUSION

Kwik-Load! is the first of a series of competitively priced (\$19.95) *Kwik-Ware!* software to be released by Datamost. All of these programs will incorporate the same high speed disk routines. It is a package well worth consideration by the budget conscious. □

1541 FLASH

Skyles Electric Works
231 E. South Whisman Road
Mountain View, CA 94041
Phone: 415-965-1735
Price: \$89.95

The Skyles Electric Works 1541 Flash consists of two eight kilobyte ROMs with associated hardware and a disk drive to computer connecting cable. The Flash is actually a replacement for the C-64 Kernel and half of the 1541 DOS. In operation, the Flash provides approximately a three to one speed improvement for all disk operations. A mini DOS wedge and some C-64 program editing support are included as well.

HARDWARE AND INSTALLATION

The 1541 Flash consists of several components. In addition to the two ROMs mentioned above, there is a

pair of printed circuit adapter boards, a cable assembly, and a combination connector/switchboard/user port extension assembly.

Installation of the Flash is not for everyone. At best it will require disassembly of both the Commodore 64 and the 1541 disk drive. At worst, considerable adaptive surgery of the C-64 circuit board will have to be performed.

On the C-64 side you will have to remove the Kernel ROM and replace

Startup screen with Flash installed.

Flash hardware components (see text).

Flash installed in C-64's user port.

Flash installed in 1541 disk drive.

it with an adapter board which allows for the simultaneous installation of two ROM chips. This will present little difficulty if your C-64 has its Kernel ROM in a socket. Many of the more recent editions of the C-64 have the chips permanently soldered into place. Extraction, in this case, is a tricky procedure involving the simultaneous unsoldering of a chip with 24 leads. This has to be done without damaging either the circuit board or the original Kernel ROM. If your C-64 has a soldered-in Kernel and your dealer is not able to perform the necessary microsurgery (a likely occurrence), Skyles will do the service for \$28.50. Given round trip transportation for the computer, this would probably be a three week minimum proposition. If you happen to be in northern California with your C-64, you may call for an appointment for an on the spot replacement.

A special adapter board replaces the original ROM chip. This consists of the replacement ROM, a second socket to allow reinstallation of the original ROM, and a pair of wires which go to a second adapter board which plugs into the user port.

The second board serves several purposes. It includes a small switch which chooses between the two ROMs now installed in the C-64. It provides a convenient termination point for the extra cable which goes to the 1541 disk drive. It connects up to two of the lines on the CIA port and it extends the user port itself for use by other accessories.

As a result, the user port contacts are fully exposed to possible electrical contact with other objects. An insulated protective cover should have been provided with the kit. Also, unlike the original C-64 contacts, the extension board is not gold plated.

In the 1541, one of the operating system ROMs has to be pried from its socket and replaced. Also, one of the 40 pin VIA chips is yanked, a pin is bent so it points away from the body of the chip, and the chip is reinstalled. A pair of micro chips on the supplied cable assembly are connected to the VIA chip. Routing of the cable completes the installation.

We felt that an adapter board with a permanent connection would have done away with the need for the microchips or any bending of chip leads. For our test installation, we rigged a 40 pin socket to eliminate the lead bending step.

OPERATION

Bryce Nesbitt is a name with which owners of the Flash will become intimately familiar. The C-64's turn on greeting message is augmented to remind you of Bryce's handiwork whenever you power up. User RAM is unaffected by the Flash. The usual 38911 bytes free appears. The switch on the user port adapter allows you to completely restore the original configuration of the C-64 by electrically switching between the original ROM and the Flash ROM. This will allow use of the computer with an unmodified disk drive or with any user port accessories which may require all of the CIA lines. The hardware change in the 1541 is irreversible. A DOS command has been added to provide a soft reset of the disk drive to permit operation with the unmodified C-64.

In operation, we found the Flash to give an approximately three to one speed improvement for all disk drive operations. This included file operations as well as program loads. The actual speed benefit varied with the particular sequence of operations. For example, *Easy Script* went from 62 to 30 seconds, *Paper Clip* from 78 to 23 seconds, and *Standing Stones* by Electronic Arts from 139 to 80 seconds. Programs which perform complex operations on multiple levels, typically databases, will also benefit from the much faster head movement which accompanies the Flash in the 1541. This high speed head movement remains in effect even when the Flash is deactivated.

COMPATIBILITY

Compatibility with commercial software is quite good. All the standard Commodore DOS commands are recognized. Most copy protected software worked without any problems, although some programs

would load only if the Flash was turned off. We did come across some samples which would not work at all with the Flash-equipped disk drive. An arrangement for the disk drive similar to the C-64, where the original ROM can be switched back in, would have been beneficial.

SYSTEM ENHANCEMENTS

The Flash includes a tiny DOS wedge which simplifies issuing disk commands and reading the error channel. The commercial at (@) symbol replaces the OPEN 15,8,15: PRINT#15, sequence when followed by any standard DOS command. The character alone reads the error channel. The disk directory can be displayed to the screen without affecting the program in memory.

The Commodore full screen editor is enhanced with several new features. These include rapid cursor movement to the bottom of the screen, a sixteen character tab, line delete, partial screen clear, and a program LISTing pause.

Several DOS commands have been added as well. These deal with the block read and write operations and are intended for programmers who wish to directly utilize the high speed Flash routines.

CONCLUSIONS

The 1541 Flash does make working with the 1541 disk drive far more comfortable. The waiting time for long files to LOAD, which used to be an everlasting tedium, has been reduced to a tolerable bore. Shorter LOADs which merely involved an annoying delay respond with a welcome snappiness. The fairly complex installation will deter many users from the purchase of a Flash. We do suggest you check your C-64 for a socketed Kernal ROM before making a final decision. The manual does include a detailed installation section, with reasonably clear photographs, which should prove adequate for anyone with some familiarity with the hardware.

Overall, the Flash was a pleasure to work with. It was not without

some reluctance that we removed it from our system after the thirty day evaluation period. □

FAST LOAD

Epyx
1043 Kiel Court
Sunnyvale, CA 94089
Phone: 418-745-0700
Price: \$40.00

The Epyx *Fast Load* utility is packaged as an eight kilobyte ROM in a plug-in cartridge. You just plug it in to the cartridge port of the C-64 and forget about it. The most dramatic improvements in disk drive speed are associated with the LOADING of long program files, the longer the better. For example, *Paper Clip* normally LOADs in one minute and eighteen seconds; with *Fast Load* it only takes fifteen seconds—a more than five to one speed up.

The performance is not nearly as impressive when you get away from straight LOAD operations. For example, *Standing Stones* from Electronic Arts normally boots in two minutes and twenty seconds. With *Fast Load* the procedure is reduced to one minute and forty seconds, a forty percent increase in speed. Another example is Commodore's *Easy Script*, where the original LOAD time of one minute and two seconds showed a mere five percent improvement at fifty nine seconds. Of course, other cartridge-based software was actually slowed up by the amount of time it takes to yank *Fast Load* from the expansion port. Finally, working from within *Easy Script*, we found no discernible difference in the time which it took to read and write text files.

A DOS WEDGE—BUILT IN

Fast Load offers far more than a five to one speed increase in program LOADs. It is actually several utilities in one package plus a number of DOS convenience features thrown in for good measure. When your C-64 is powered up with the *Fast Load* cartridge in place, the only discern-

ible difference is the product name along with the usual sign-on message. Do not let this lull you into a false sense of smug somnambulance. Lurking at your fingertips are a myriad of hitherto unavailable features just awaiting your beck and call.

The first and foremost is an instant DOS wedge. To get a directory listing just type "\$" (that's SHIFT 4 for all you neophytes) and hit RETURN. Voila, the directory scrolls by right

before your eyes. Furthermore, any program residing in the computer's memory remains totally oblivious to the turmoil taking place around it. The only drawback was that there seemed to be no way to slow down or put a halt to the process. Once started, the directory seemed most determined to scroll by to its final conclusion where it profoundly proclaims the disk BLOCKS FREE message.

Hitting RUN/STOP and RESTORE just made matters worse. The screen cleared and the drive went off to sulk, apparently on an endless binge of disk spinning. Even depriving it of its orbiting celluloid had no noticeable effect. Despair not; the commercial at (@) is available for inquiring into the health and well-being of the disk drive as it reads the DOS error channel. Exercising its function brings a response of blissful contentment (a display of 00 OK 00 00) shortly followed by a cessation of all rotary motion.

One other peculiarity commanded our attention. The traditional means of querying the disk contents, namely LOAD "\$",8, returned a gaggle of worthless gibberish. However, the slash (/) character, which is now available in addition to the traditional LOAD command, served well in the classical sense. The directory thus LOADED retains its useful meaning. Other handy characters are the percent (%) symbol which replaces the binary LOAD "FILE",8,1 sequence and the left arrow (←) which replaces the BASIC SAVE.

Last but not least, the well-known LOAD "***",8,1 sequence, used by many purveyors of commercial software, is now available by the simultaneous depression of the Commodore logo and RUN/STOP keys.

THE DISK TOOL

In addition to the built-in Wedge, *Fast Load* has a series of utilities referred to as the *Disk Tool*. Upon critical analysis, we would consider these a full-fledged crowbar. The British Pound key is used to access the *Tool* utilities. These are most comprehensive. Included are:

- A single file copy utility which is limited to program files.
- A full disk copy utility which allows for preformatted as well as post-formatted disks. This routine takes about ten minutes.
- A BAM-directed disk copy utility. This will only copy sectors which are marked as allocated on the block availability map.
- A disk sector editor utility. This allows you to read any disk sector,

Nobody copies better !!

A Printer For All Reasons

Search For The Best High Quality Graphic Printer

If you have been looking very long, you have probably discovered that there are just too many claims and counterclaims in the printer market today. There are printers that have some of the features you want, but do not have others. Some features you probably don't care about; others are vitally important to you. We understand. In fact, not long ago, we were in the same position. Deluged by claims and counterclaims. Overburdened by rows and rows of specifications, we decided to separate all the facts — prove or disprove all the claims to our own satisfaction. So we bought printers. We bought samples of all major brands and tested them.

Our Objective Was Simple

We wanted to find that printer which had all the features you could want and yet be sold directly to you at the lowest price. We wanted to give our customers the best printer on the market today at a bargain price.

The Results Are In

The search is over. We have reduced the field to a single printer that meets all our goals (and more). The printer is the GP-550 from Seikosha, a division of Seiko. We ran this printer through our battery of tests and it came out shining. This printer can do it all. Standard draft printing up to a respectable (and honest) 86 characters per second, and with a very readable 9 (horizontal) by 8 (vertical) character matrix. At this rate, you will get an average 30 line letter printed in only 28 seconds.

"NLQ" Mode

One of our highest concerns was about print quality and readability. The GP-550 has a print mode termed Near Letter Quality printing (NLQ mode). This is where the GP-550 outshines all the competition. Hands down! The character matrix in NLQ mode is a very dense 9 (horizontal) by 16 (vertical). This equates to 14,400 addressable dots per square inch. Now we're talking *quality* printing. You can even do graphics in the high resolution mode. The results are the best we've ever seen. The only other printers currently available having resolution this high go for \$500 and more *without* the interface or cable needed to hook up to your computer.

Features That Won't Quit

With the GP-550 your computer can now print 40, 48, 68, 80, 96, or 136 characters per line. You can print in ANY of 18 font styles. You not only have the standard Pica, Elite, Condensed and Italics, but also true Superscripts and Subscripts. Never again will you have to worry about how to print H_2O or X^2 . This fantastic machine will do it automatically, through easy software commands right from your keyboard. All fonts have true descenders.

One of the fonts we like best is "Proportional" because it looks most like typesetting. The spacing for thin characters like "i" and "l" are given less space which "tightens" the word making reading easier and faster. This is only one example of the careful planning put into the GP-550.

Do you sometimes want to emphasize a word? It's easy, just use **bold** (double strike) to make the words stand out. Or, if you wish to be even more emphatic, underline the words. Or do **both**. You may also wish to "headline" a title. Each basic font has a corresponding elongated (double-wide) version. You can combine any of these modes to make the variation almost endless. Do you want to express something that you can't do with words? Use graphics with your text — even on the same line.

You can now do virtually any line spacing you want. You may select 6, 8, 7½ or 12 lines per inch. PLUS you have variable line spacing of 1.2 lines per inch to infinity (no space at all) and 97 other software selectable settings in between. You control line spacing on a dot-by-dot basis. If you've ever had a letter or other document that was just a few lines too long to fit a page, you can see how handy this feature is. Simply reduce the line spacing slightly and ... VOILA! The letter now fits on one page.

Forms? Yes!

Your Letterhead? Of Course!

Do you print forms? No problem. This unit will do them all. Any form up to 10 inches wide. The tractors are adjustable from 4½ to 10 inches. Yes, you can also use single sheets. Plain typing paper, your letterhead, short memo forms, anything you choose. Any size under 10" in width. Multiple copies? Absolutely! Put forms or individual sheets with carbons (up to 3 deep), and the last copy will be as readable as the first. Spread sheets with many columns? Of course! Just go to condensed mode printing and print a full 136 columns wide. Forget expensive wide-carriage printers and changing to wide carriage paper. You can do it all on a standard 8½" page.

Consistent Print Quality

Most printers have a continuous loop ribbon cartridge or a single spool ribbon which gives nice dark printing when new, but quickly starts to fade after a while. To keep the printers' output looking consistently dark, the ribbons must be changed more often than is healthy for the pocketbook. The GP-550 solves this problem completely by using a replaceable, inexpensive ink cassette which is separately replaceable from the actual ribbon. It keeps

the ribbon loaded with ink at all times. You only replace the ribbon when it truly wears out, not when it starts to run low on ink. Just another example of the superb engineering applied to the GP-550. (When you finally do wear out your ribbon, replacement cost is only \$10.95. Ink cassette replacement cost is only \$5.95, both postpaid.)

The Best Part

When shopping for a quality printer with all these features, you could expect to pay around \$500 or more. *Not any more!* We have done our homework. You don't have to worry about interfaces or cables. Everything is included. You need absolutely nothing else to start printing — just add paper.

No Risk Offer

We give you a 15-day satisfaction guarantee. If you are not completely satisfied for any reason we will refund the full purchase price. A 1-year warranty is included with your printer.

©1984 APROPOS TECHNOLOGY

modify it, and write it back to any sector on the disk.

- A file utility which allows for locking and unlocking files (prevents inadvertent scratching), and renaming and copying of program files.

Overall, a rather nice collection of utilities to have in one place.

ML MONITOR

The *Fast Load* cartridge includes a machine language monitor. This program provides a full range of machine code disassembly and memory display modes, access to the disk directory and command channel, and both relocating and non-relocating binary LOADs. A full array of logical and arithmetic operators are available for easy calculation of pertinent parameters. Hexadecimal, decimal, binary, and ASCII conversion are built in. About the only thing lacking is the customary single-line mini assembler.

A COUPLE OF QUIRKS

We noticed some additional oddi-

ties worth passing on to the potential user. Executing a call to the C-64 reset vector (SYS 64738) restores the C-64 to the power-up state as if the *Fast Load* cartridge were not there. Resetting via a hardware reset button brings the *Fast Load* cartridge back online. The *Fast Load* cartridge may also be disabled via a command from the built-in *Disk Tool* utility.

A GOOD RETURN

The *Fast Load* cartridge offers a wide array of features in a compact package. The operation is surprisingly transparent to all the forms of commercial copy protection we have looked at. For the few exceptions, *Fast Load* may be totally disabled via the built-in soft switch without physically removing the cartridge. Overall, it may not be the fastest disk speedup utility, but it certainly offers a good return for the dollar. □

CONCLUSIONS

Of the three products we looked at, the Skyles Flash should provide

the greatest overall improvement in disk handling with the 1541 disk drive. This is a direct result of applying the speedup routines to all disk operations under all operating conditions. If you can handle the relatively complex installation, then the Flash will significantly cut down on time spent waiting for the drive.

In terms of greatest convenience and utility, we place our bets on the Epyx *Fast Load*. The cartridge format makes for fast and foolproof installation as well as portability. As with the Flash, it is instantly available on power up. It also has the widest selection of built-in support utilities. Advanced users will be pleased by the instant availability of the powerful ML monitor.

The *Kwik-Load!* package offers a good value. The disk copy and backup utilities win the prize for speed. Given the low cost, you may just not want to pass this one up. □

EPILOGUE

Not being content to leave well enough alone, we present some last-minute updates on the Skyles Flash and the Epyx *Fast Load* cartridge. This information came to us just before we went to press on this issue.

THE 1541 FLASH

Skyles has indicated that the latest version of the Flash will include a defeat switch for the disk drive as well as the computer. This allows the Flash to be completely disconnected from the system. The price of the new unit will be \$99. Present users may upgrade for \$15 plus \$3.50 shipping and handling. Work is nearly complete on a two disk version of the Flash which will sell for \$139.95 (\$49.95 for the upgrade). We hope to report on this when it comes available.

FAST LOAD

A second sample of the Epyx *Fast Load* cartridge appeared unannounced upon our doorstep. Although all external indications appeared identical to our first sample, we gave it a try. Much to our surprise, we found some subtle improvements. This latest revision properly handles the LOAD"\$",8 command we discussed earlier. Epyx is apparently busy swatting bugs as fast as they find out about them. This latest version of *Fast Load* brings the count up to three revisions which we know about. At this rate, the product should be well in hand by the time you read this report.

DOS PLUS

A DISK OPERATING SYSTEM ENHANCEMENT UTILITY

The 1541 (or compatible) disk drive offers significant advantages over cassette as a storage medium, random access and speed of access being but two such. When you first purchased your drive unit you most likely realized a leap in your productivity and programming throughput. However, you soon came to see that although the 1541 allows you to harness some of the power of the Commodore 64, it can be cumbersome to use. Many programmers have set out to help rectify this by designing various utilities that make using a disk drive easier. While these solve some of the difficulties of disk drive usage, they create another problem: you end up with a disk full of programs, one to do single-file copies, another to list the directory, another that allows you to 'unscratch' a file, and still another to find the load address of a file. Whew! Are things really easier now?

I thought not—so I sat down, and after a little head scratching came up with *Dos Plus*. *Dos Plus* gives you a powerful set of tools with which you can better manage your 1541 disk drive. The real power of *Dos Plus* is that you needn't keep an arsenal of utilities on disk waiting to be used. *Dos Plus* is in itself just such an arsenal. You need only load it once. It will tuck itself away above BASIC memory and wait patiently for your commands.

First type in *DOS Boot* (see page 98) and save it to disk. Then, using the *Flankspeed* program on page 86, type in and save *DOS Plus*. Then type NEW, and load and run *DOS Boot*.

DOS Boot will also let you change certain default parameters of your copy of *Dos Plus*. More on that later in this article.

You now have an error-free working copy of *Dos Plus*. But what exactly do you have? Let's see. First, list the directory by typing '@\$'. *Dos Plus* gives much useful information here. The load address of the program is listed to the right of your screen in hex and decimal. Block count is given, as in other Wedge programs. If your disk contains deleted files they will be listed as such, with a 'DEL' signifying the fact. You may abort the listing of a directory by holding down the RUN/STOP key. You may have to hold this key until it 'catches,' because the keyboard is polled between accesses to disk. Likewise, the space bar will pause a listing, with any other key cancelling the pause function. Again, you will have to hold the space bar until the pause takes effect. If you wish to list the directory directly to a printer on the serial port, hit the f1 or f3 keys before you issue the @\$ com-

mand. If your printer answers to device number 4, use the f1 key. If your printer answers to device number 5, use the f3 key. Be careful that you use the correct key for your printer. If the computer attempts to open a channel to a non-existent device, the program will 'hang.' You can recover from this only by using the RUN/STOP-RESTORE combination. If you accidentally press f1 or f3 or wish to cancel a dump to the printer, POKE 923,0 to cancel the dump flag. The dump to printer function is automatically cancelled after the dump is completed or, alternately, if you abort the total listing of the directory with the RUN/STOP key.

Let's try another tool. Type the following:

```
@:D18,1 <RETURN>
```

This is the SECTOR DUMP/MODIFY command. Magically, the first sector of the disk directory is listed to the screen. You may use the cursor keys to move the cursor to any position within the block. If you make any changes to the block, the entire block will be rewritten to disk as modified. If you accidentally enter an invalid digit, i.e., 0Z or P8, the rewrite feature will abort. You can use this command structure to do many things. You can unscratch a file by changing the third byte preceding the first character of a filename from 00 to 82. The unscratch will be successful only if no saves were made to disk after the file was scratched. This feature is primarily useful when you inadvertently scratch a file. Alternately, you might wish to change a sequential file to a program file or a user file to a sequential file. A sector, or block, can be dumped directly to your printer in the same manner as described for directory listings to printer. Again, make use of the f1/f3 keys prior to issuing the @:D command. After the printer dump is complete, the sector will be listed to the screen where you may modify it or exit by pressing RETURN. I would advise that you practice using the @:D function on an expendable disk. This function is very powerful and can generate disastrous results if used carelessly.

This one you've already used:

```
@:[BACKARROW]'FILENAME',$(START ADDRESS)  
,$(END ADDRESS+1)
```

You use this command structure to save a file from other

COM-STAR T/F

Tractor
Friction
Printer

only \$ **169****

- Lowest Priced, Best Quality, Tractor-Friction Printers in the U.S.A.
- Fast 80-120-160 Characters Per Second • 40, 46, 66, 80, 96, 132 Characters Per Line Spacing
- Word Processing • Print Labels, Letters, Graphs and Tables • List Your Programs
- Print Out Data from Modem Services • "The Most Important Accessory for Your Computer"

**DELUXE COMSTAR T/F 80 CPS Printer \$169.00

This COMSTAR T/F (Tractor Friction) PRINTER is exceptionally versatile. It prints 8½" x 11" standard size single sheet stationery or continuous feed computer paper. Bi-directional, impact dot matrix, 80 CPS, 224 characters. (Centronics Parallel Interface).

Premium Quality 120-140 CPS 10X COM-STAR PLUS+ Printer \$199

The COM-STAR PLUS+ gives you all the features of the COMSTAR T/F PRINTER plus a 10" carriage, 120-140 CPS, 9 x 9 dot matrix with double strike capability for 18 x 18 dot matrix (near letter quality), high resolution bit image (120 x 144 dot matrix), underlining, back spacing, true lower descenders with super & subscripts, prints standard, italic, block graphics & special characters. It gives you print quality and features found on printers costing twice as much!! (Centronics Parallel Interface) (Better than Epson FX80). RATED "BEST BUY" BY CONSUMERS DIGEST BUYERS GUIDE, JANUARY 1985! List \$499.00. Sale \$199.00.

Premium Quality 120-140 CPS 15½" COM-STAR PLUS+ Business Printer \$319.00

Has all the features of the 10" COM-STAR PLUS+ PRINTER plus 15½" carriage and more powerful electronics components to handle large ledger business forms! (Better than Epson FX 100). List \$599. Sale \$319.00.

Superior Quality 15½" COM-STAR PLUS+ H.S. High Speed 160-180 CPS Business Printer \$449.00

15½" Carriage and more powerful electronic components to handle larger ledger business forms! (Serial Centronics Parallel Interface). List \$799. Sale \$449.

12" DAISY WHEEL PRINTER \$199.00

"JUKI" Superb letter quality daisy wheel printer, 12" extra large carriage, up to 12CPS bi-directional printing, drop-in cassette ribbon, (90 day warranty) centronics parallel or RS232 serial port built in! (Specify). List \$299.00. Sale \$199.00.

Superior Quality 10" COM-STAR+ H.S. HIGH SPEED 160-180 CPS Business Printer \$349.00

This Super High Speed Com-Star+ Business Printer has all the features of the 10" COM-STAR+ PRINTER with HIGH SPEED BUSINESS PRINTING 160-180 CPS, 100% duty cycle, 8K Buffer, diverse character fonts, special symbols and true descenders, vertical and horizontal tabs. A RED HOT BUSINESS PRINTER at an unbelievable low price (Serial or Centronics Parallel Interface). List \$699.00. Sale \$349.00.

Printer/Typewriter Combination \$249.00

"JUKI" Superb letter quality, daisy wheel printer/typewriter combination. Two machines in one — just a flick of the switch. 12" extra large carriage, typewriter keyboard, automatic margin control and relocate key drop in cassette ribbon! (90 day warranty) centronics parallel or RS232 serial port built in (Specify). List \$399.00. \$249.00.

Floppy Disk Filer

Everyone Needs a Floppy Disk Secretary

Facts:

- Dust and Dirt particles can hurt your disks
- Most disks go bad due to mishandling in storage
- Proper filing of your disk collection will reduce unnecessary handling of your disks

The Floppy Disk Filer is an inexpensive hard plastic Flip-top case that will allow for easy filing, and protect your disks from dust, smoke, and dirt. Plus, the Floppy Disk Filer will keep all your disks out of unwanted hands and in one place where you can easily find them. **(Holds Over 50 Disks)**

1541 FLASH!™ THE CRITICS SPEAK OUT

This advertisement has been written by independent reviewers of Commodore computer products. We thank them for their frankness and the high marks awarded to the Skyles Electric Works 1541 FLASH!.

The Reviewers Comment

"Tired of that slow disk drive? The solution is here, and it costs about \$90. Considering what it does, the price is a bargain! It speeds up your 1541 disk drive 200%-300%. And if you write your own software specially for the FLASH!, you can achieve speed increases of 600%!

The 1541 FLASH! is the best! It's better than KWIK LOAD!™ And better than 1541 Express.™

Does it sound too good to be true? Do you suspect there must be some drawback that I haven't mentioned? Well... There is one. You have to open up your keyboard and 1541 drive and do a little work inside them. You need to replace a couple of chips with new ones provided by the FLASH!. And an extra cable will run from your keyboard's user port to your 1541 drive. But the installation is explained in complete detail with pictures. It's a simple operation that will take under 30 minutes. And in return you will have a disk drive that literally races along!

The biggest complaint with the Commodore 64 is the slow disk drive. No more! You will never be willing to go back after having used the 1541 FLASH!. It really spoils you! It's even faster than a parallel drive with an IEEE interface! Don't be afraid of the installation. It's really simple. And if you prefer not to do it yourself, your local user's group probably has people with the ability to install it for you. You'll be glad you did!"

The Northwest Users Guide, Jan. 1985

"A tiny wedge is included... you simply SYS63526 to enable it. Those who enjoy using the wedge as part of their normal computer will like this feature.

The utilities added by FLASH! include single, double and simultaneous keystroke implementation of such niceties as delete line, escape quote, cursor to bottom of screen, 16 character tab, and return without line execution.

My children have played some of their favorite games and used utilities or educational software without any problems whatsoever, using the 1541 FLASH! All in all, this device will save the purchaser much of the frustration normally experienced, as well as the time required in normal disk drive-computer interactions. With the above noted exception, I'm very pleased with its operation, and won't hesitate to recommend it to those who would like faster loads and saves or want additional flexibility and power at a moderate price."

RUN, May 1985

"Having used 1541 FLASH! for several days, already I can't bear to go back to a slow 1541. It's amazing how quickly you can get spoiled by a luxury like this. More than a few editors here have cast covetous eyes on the upgraded 64/1541. And the price is reasonable for such a dramatic enhancement. After reading the installation description above, you can decide if you're up to opening your equipment, yanking out chips, and enjoying a 300% speedup."

Compute!'s Gazette, Jan. 1985

COLUMN 2: By the Numbers

The Binary, Hexadecimal, and Decimal Notation Systems

By Mark Andrews

Three kinds of number systems are commonly used in assembly language programming. They are:

(1) *Decimal numbers*, based on the value 10 and written using the Arabic numerals 0 through 9.

(2) *Binary numbers*, based on the value 2 and usually written using the Arabic numerals 0 and 1.

(3) *Hexadecimal numbers*, based on the value 16 and customarily written using the Arabic numbers 0 through 9, plus the letters A through F. The digits 1 through 9 are used just as in conventional decimal notation, and the letters A through F as single-unit symbols for the values 10 through 15.

Decimal numbers are what most of us learned in school so not much will be said about them. Instead, we'll focus on the binary and hexadecimal number systems. Let's start with binary numbers.

The ones and zeroes that make up binary numbers are known as *bits*. A series of four bits is called a *nibble* (or *nybble*), a series of eight bits is called a *byte*, and a series of 16 bits is called a *word*.

PENGUIN MATH

The best way to explain the principles of the binary system is with something I call Penguin Math. Penguin Math is the number system that penguins would probably use if penguins could use numbers.

Imagine that you're a penguin. You wouldn't have 10 fingers on each hand, so there'd be no way you could count on your fingers. You'd have just two flippers, and if you wanted to count on something, you'd have to count on them.

Suppose that you're a very bright penguin, and did learn to count on your flippers. You wouldn't be able to count to 10. But you would be able to count to 2.

Now suppose that you're the smartest penguin on Penguin Island. If you were that sharp, you might figure out how to use your flippers to count past 2. Here's one way you could do that.

Instead of counting on your flippers the same way humans count on their fingers, you could decide to equate a raised right flipper to 1, and a raised left flipper to 2.

Then you could let two raised flippers represent the value 3.

Now suppose you were the Albert Einstein of Penguin Island, and devised a new mathematical system to express in writing what you had done.

You could use a 0 to represent an unraised flipper, and a 1 to represent a raised one. And then you could scratch these equations in the ice:

00 = 0
01 = 1
10 = 2
11 = 3

AHA! FEET, TOO!

Those are, of course, binary numbers. And they clearly show that if you were a really smart penguin, you could use two flippers to express the values 0 through 3. That's a clear improvement over the two values that can be represented with more traditional flipper-counting methods.

Since our imagination has taken us this far, let's now suppose that you (still a penguin) wanted to learn to count past 3. While pondering this problem, you might look down at your feet—and notice two more flippers down there.

Voila—bigger numbers!

By using both flippers and both legs at the same time, you could count as follows:

FOUR-BIT PENGUIN MATH

0000 = 0
0001 = 1
0010 = 2
0011 = 3
0100 = 4
0101 = 5
0110 = 6
0111 = 7
1000 = 8
1001 = 9

...and so on.

If you continued counting like this, you would eventually discover that you could express 16 values—0 through decimal 15—using four-digit (or four-bit) binary numbers.

ONE MORE LESSON

Now we're ready for one last lesson in Penguin Math. Imagine that you marry another penguin. And, using your skill with binary numbers, you determine that you and your spouse have a total of eight flippers between you.

If your spouse decides to cooperate with you in counting with flippers, the two of you could now sit on your ice and start a floe chart with numbers that look like these:

0000 0001	= 1
0000 0010	= 2
0000 0011	= 3
0000 0100	= 4
0000 0101	= 5

If you and your spouse kept on counting in this fashion—using 8-bit Penguin Math—you would eventually discover that by using eight flippers, you could count from 0 (or 0000 0000) to 255 (or 1111 1111), for a total of 256 values.

That completes this crash course in Penguin Math. What it has demonstrated is that it is possible to express 256 values—from 0000 0000 through 1111 1111—using 8-bit binary numbers.

THE HEXADECIMAL NUMBER SYSTEM

Since computers “think” in binary numbers, the binary system is obviously an excellent notation system for representing computer data. But, as you may remember from last month's column, binary numbers have one serious shortcoming: they're extremely difficult to read. So the binary system is not the numeric system most often used in assembly language programming. The numeric system you'll encounter most often in assembly language programming is *hexadecimal*.

Just as binary numbers are based on the value 2, hexadecimal numbers are based on the value 16. If people were born with eight fingers on each hand, we would probably all count in hexadecimal numbers.

Hexadecimal numbers are often used in assembly language programming because they can help bridge the gap between the binary and decimal systems. Since binary numbers have a base of 2, and hex numbers have a base of 16, a series of four binary bits can always be translated into one hexadecimal digit. So a series of eight bits (a “byte”) can always be represented by a pair of hexadecimal digits, and a series of 16 bits (a “word”) can always be represented by a four-digit hexadecimal number.

Here is a table comparing decimal, hexadecimal, and binary numbers. Observe that odd-looking letter-and-

number combinations like “FC1C”, “5DA4”, and even “ABCD” are perfectly good numbers in the hexadecimal system.

DECIMAL	HEXADECIMAL	BINARY
1	1	00000001
2	2	00000010
3	3	00000011
4	4	00000100
5	5	00000101
6	6	00000110
7	7	00000111
8	8	00001000
9	9	00001001
10	A	00001010
11	B	00001011
12	C	00001100
13	D	00001101
14	E	00001110
15	F	00001111
16	10	00010000

As you can see, the decimal number 16 is written “10” in hex and “00010000” in binary, and is thus a round number in both the binary system and the hexadecimal system. And the hexadecimal digit F, which comes just before hex 10 (or 16 in decimal), is written 00001111 in binary.

As you become more familiar with the binary and hexadecimal systems, you will begin to notice many other similarities. For example, the decimal number 255 (the largest 8-bit number) is 11111111 in binary and FF in hex. The decimal number 65,535 (the highest memory address in a 64K computer) is written FFFFFFFF in hex and 11111111 11111111 in hex.

CONVERTING BINARY NUMBERS TO DECIMAL NUMBERS

It isn't very difficult to convert a binary number to a decimal number. In a binary number, as we've seen, the bit farthest to the right represents 2 to the power 0. The next bit to the left represents 2 to the power 1, the next represents 2 to the power 2, and so on.

The digits in an 8-bit binary number are therefore numbered 0 to 7, starting from the rightmost digit. The rightmost bit—often referred to as Bit 0—represents 2 to the 0th power, or the number 1. And the leftmost bit—often called Bit 7—is equal to 2 to the 7th power, or 128.

The following is a list of simple equations that illustrate what each bit in an 8-bit binary number means.

VALUES OF THE BITS

IN AN 8-BIT BINARY NUMBER

Bit 0	= 2 to the 0th power	= 1
Bit 1	= 2 to the 1st power	= 2
Bit 2	= 2 to the 2nd power	= 4
Bit 3	= 2 to the 3rd power	= 8

Bit 4 = 2 to the 4th power = 16
 Bit 5 = 2 to the 5th power = 32
 Bit 6 = 2 to the 6th power = 64
 Bit 7 = 2 to the 7th power = 128

The above table provides an easy method of converting any 8-bit binary number into its decimal equivalent. Instead of writing the number down from left to right, write it instead in a vertical column, with Bit 0 at the top and Bit 7 at the bottom. Then multiply each bit in the binary number by the decimal number that it represents. Then add up the results of all of these multiplications—and the total you get will be the decimal value of the binary number.

Suppose, for example, that you wanted to convert a binary number 00101001 into a decimal number. Here's how you could do it:

CONVERTING A BINARY NUMBER INTO A DECIMAL NUMBER

1 ×	1 =	1
0 ×	2 =	0
0 ×	4 =	0
1 ×	8 =	8
0 ×	16 =	0
1 ×	32 =	32
0 ×	64 =	0
0 ×	128 =	0
TOTAL		= 41

00101001 AND OTHER FANCY NUMBERS

If the calculation in the above example is correct, the binary number 00101001 should be equivalent to the decimal number 41 (that's decimal 41, not hex \$41, for those already familiar with hexadecimal notation). Look up either 00101001 or 41 on any binary-to-decimal or decimal-to-binary conversion chart, and you'll see that the calculation was accurate. And this conversion technique will work with any other binary number.

CONVERTING A BINARY NUMBER TO A DECIMAL NUMBER

Now we'll go in the other direction, and convert a decimal number to a binary number.

First, divide the number by 2. Then write down both the quotient and the remainder. Since we're dividing by 2, the remainder will be either a 1 or 0. So what we write down will be the quotient followed by either a 1 or a 0.

Next we'll take the quotient, divide it by two, and write the result down. If there's a remainder (a 1 or a 0), we'll write that down, too, underneath the first remainder.

When there are no numbers left to divide, we'll write down all of the remainders we got, reading from the bottom to the top. What we'll have then, of course, is a binary number—a number made up of ones and zeroes.

And that number will be the binary equivalent of the decimal number we started out with.

This conversion technique is illustrated in the following example:

CONVERTING A DECIMAL NUMBER TO A BINARY NUMBER

117/2 =	58 with a remainder of 1
58/2 =	29 with a remainder of 0
29/2 =	14 with a remainder of 1
14/2 =	7 with a remainder of 0
7/2 =	3 with a remainder of 1
3/2 =	1 with a remainder of 1
1/2 =	0 with a remainder of 1
0/2 =	0 with a remainder of 0

HOW TO DO IT

To complete the decimal-to-binary conversion presented in this example, simply copy the binary digits in the right-hand column, writing them down horizontally from right to left, with the top digit on the right. You'll then see that the binary equivalent of the decimal (not hexadecimal) number 117 is 01110101. If you have a decimal-to-binary conversion chart handy, you can use it to confirm this.

kyan PASCAL

for the Commodore 64

kyan pascal is a full implementation. With a single disk drive and C64, you can learn Pascal and develop sophisticated programs.

kyan pascal is perfect for classroom or home use. Its Menu-Driven, User-Friendly operating environment helps students learn quickly and lets advanced programmers develop programs 4 to 40 times faster than Commodore Basic.

kyan pascal features:

- Full Screen Editor with Powerful Text Editing Functions.
- MERGE and Other Convenient File Management Functions.
- Fully Resident Software to Eliminate Disk Swapping.
- HELP Screens to Speed Learning.
- Stand-Alone Runtime Environment.
- AND, A Comprehensive Tutorial Manual with Sample Programs.

15 DAY TRIAL

Try *kyan pascal*. If you are not completely satisfied, return diskette and manual in 15 days for a full refund.

kyan pascal with tutorial manual **\$49.95**
(Add \$4.50/copy for postage and handling. \$9.50 outside North America. California residents add 6.5% sales tax.)

BINARY-TO-HEX AND HEX-TO-BINARY CONVERSIONS

It's easy to convert binary numbers to their decimal equivalents. Just use this chart:

HEXADECIMAL-TO-BINARY CONVERSION CHART

HEXADECIMAL	BINARY
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001
A	1010
B	1011
C	1100
D	1101
E	1110
F	1111

The above table shows how to convert a multiple-digit hex number to binary notation: merely string the hex digits together and convert each one separately. For example, the binary equivalent of the hexadecimal number C0 is 1100 0000. The binary equivalent of the hex number 8F2 is 1000 1111 0010. The binary equivalent of the hex number 7A1B is 0111 1010 0001 1011.

To convert binary numbers to hexadecimal numbers, use the chart in reverse. The binary number 1101 0110 1110 0101, for example, is equivalent to the hexadecimal number D6E5.

DECIMAL-TO-HEXADECIMAL CONVERSION

It's almost as easy to convert decimal numbers to hexadecimal as it is to translate binary to decimal. Here's how it's done:

First, take a decimal integer that you want to convert, and divide it by 16. Then write down the remainder, like this:

$$64540/16 = 4033 \text{ with a remainder of } 12$$

Then divide the integer part of the above quotient by 16, and write down the result of that calculation:

$$4033/16 = 252 \text{ with a remainder of } 1$$

Keep repeating this process until you have a quotient of zero. Here's the entire set of calculations needed to convert the decimal number 34761 into a hexadecimal number:

$$\begin{aligned} 64540/16 &= 4033 \text{ with a remainder of } 12 \\ 4033/16 &= 252 \text{ with a remainder of } 1 \\ 252/16 &= 15 \text{ with a remainder of } 12 \\ 15/16 &= 0 \text{ with a remainder of } 15 \end{aligned}$$

When you've finished this series of calculations, you must convert any remainder greater than 9 into its hexadecimal equivalent. In the above problem, three remainders are greater than 9: the value 12 in the first line, the value 12 in the third line, and the value 15 in the fourth line. The decimal number 12 equates to the letter C in hexadecimal notation, and the decimal number 15 equates to the letter F. So the remainders, converted into hex, are:

C
1
C
F

Read the above four numbers, starting from the bottom and reading up, and you have the hexadecimal number

FC1C

— which is the number we're looking for — the hexadecimal equivalent of the decimal number 64540!

DOING IT THE EASY WAY

We've compared three different number bases: the decimal system, the hexadecimal system, and the binary system. And now you know how to convert numbers from any of these three bases to any other, in either direction. Some of the conversion techniques we've covered are quite simple, others are fairly complicated, and unless you have a photographic memory, you may not remember any of them by tomorrow morning. But fortunately, you won't have to. Now that you know the principles involved, I'll tell you about an easier way to make number-base conversions. Just type and save the program presented in Listing 1 (on page 93) and you can let your computer do it for you!

By the Numbers is a menu-driven BASIC program that can convert numbers from any of the three bases discussed in this article to any other.

In next month's column, *Under the Hood*, we'll take a look inside your Commodore's main microprocessor and see what makes it tick. Then, finally, we'll be ready to start writing some programs in assembly language. □

MAKE NO MISTAKE...

CALKIT for your Commodore 64 is a powerful, real-world problem solver. Faster, easier and more accurate than pencil, paper and calculator — and a lot less frustrating.

FOR
COMMODORE 64

CalKit helps you solve household and small business problems that involve rows and columns of numbers.

- balance your chequebook in seconds
- plan your home or business budget with ease
- simplify your income tax, and your investment portfolio
- calculate loan or mortgage payments, and then find out what happens to them in seconds, when interest rates change

That's the real advantage — with CalKit, you can change any number in your equation, and see how it affects the other numbers. All calculations are performed instantly! CalKit gives you the answers, in the

time it takes to ask "What If...?" You can make projections and plan ahead with confidence!

The CalKit problem-solving package includes built-in templates for the most important home and business needs. Over 20 ready-to-use, real-life applications on one disk. The rows, columns and calculations are already defined. No need for time-consuming initial set-ups — all you do is enter your data. Other CalKit features, like on-screen menu and simple commands, make it even easier.

An easy and comprehensive manual with tutorials on each application are included. You'll be using CalKit like a pro, right out of the box. And once you've mastered the built-in templates, you'll be ready for your own unique spreadsheet programs.

Powerful solutions + ease of use + low low cost = CalKit. It all adds up to exceptional value, for a computer program that can help you every day.

THE HARDWARE INTERRUPT WEDGE

Sixty times each second the VIC and C-64 are interrupted by an internal clock. At that point they stop what they are doing and service the interrupt. They check the keyboard, update the screen and TIS, and then resume whatever they were doing when interrupted.

It is possible to "wedge" into this interrupt handler and have some of our own activities handled in background, independent of our main program. You may want to scroll a game background scene. You may want to perform some utility function such as handle the joystick or possibly take each key pressed and print it on your printer as well as on the screen. It's possible to do all this and more. The process is easy to understand and implement.

The sample programs on page 107 perform a simple operation but serve to demonstrate how to set up, enable, utilize, and, when finished, disable such a wedge. The programs are listed as BASIC loaders; a machine language assembly listing is included here so you can follow along with the explanations. The assembly listing is from the Commodore assembler.

UNDERSTANDING THE INTERRUPT

To help us understand what's going on, let's first discuss the hardware interrupt in general. We'll use the VIC and C-64 for illustration, but this applies in a general way to all microcomputers which use the 6502 or 6510 microprocessor chip. The hardware interrupt occurs 60 times each second and is processed by the 6502 (or 6510) CPU chip. All 6502's (or 6510's), on receiving a hardware interrupt, look to the pointer speci-

fied in ROM locations \$FFFE, \$FFFF (low byte, high byte). This pointer 'points' to the first address of the routine, which handles the interrupt. In the VIC it points to \$FF72 in ROM (\$FF48 in the 64). When the interrupt is recognized, the processor status register and program

counter are stored on the stack and control is transferred to the routine beginning at address \$FF72 (or \$FF48). This routine saves the processor registers (A,X,Y) on the stack. This routine then does an indirect jump to whatever address is contained in RAM locations \$0314,

FOR THE VIC AND C-64

A MACHINE LANGUAGE TUTORIAL FOR BEGINNING AND INTERMEDIATE ML PROGRAMMERS

By Calvin Overhulser

\$0315. This is referred to as the vector location. When power was turned on, the start-up routine set these locations to point to ROM location \$EABF (\$EA31 in the 64). At \$EABF (or \$EA31) begins the routine to take care of the keyboard, screen, and TI\$.

When this routine finishes, it restores all processor registers and returns the CPU to where it left off when the interrupt was recognized. The key to all this is RAM locations \$0314, \$0315. Since they are RAM, we can put our own address in them. Later, when the interrupt is recognized, we can perform our own activities and then jump to \$EABF (or \$EA31) to allow the normal housekeeping.

HOW TO MAKE IT WORK

Make sure any memory expanders are unplugged on the VIC. Enter the appropriate BASIC loader for your computer at the keyboard and RUN it. The BASIC loader POKes the machine language from the DATA statements into the cassette buffer. Next, start it all off by typing SYS828 followed by the RETURN key at the keyboard. This takes us to our setup routine at \$033C. Now follow along while looking at the assembly listing. We wouldn't want an interrupt to occur while we are changing its vector, so first we lock out interrupts in line 16. Then we change the vector to point to our own routine, enable interrupts, and return to the main program with RTS in line 22.

Now the fun begins! From now on, our routine, beginning in line 26, will run first when the interrupt occurs. Hit a key and watch what happens; a character is printed in the center of the screen. You may notice the character is not the one you press. This is because we are taking the

code from the register holding the decoded keyboard matrix and storing it on the screen. These codes are different than the screen codes and this causes the strange character to appear. After we put the character on the screen in line 27, we put the code for purple in the corresponding color memory location in line 30. Last, in line 32, we jump to the normal housekeeping routine. This all occurs 60 times each second.

To disable our routine and put everything back to normal, just type SYS854 followed by RETURN. SYS854 takes us to line 37 in the assembly listing which puts the vector back to normal. Hitting the RUN/STOP and RESTORE keys will have

the same effect. Make sure you disable our interrupt routine before you try to SAVE or LOAD tape, otherwise there will be a conflict since the routine resides in the cassette buffer.

APPLICATIONS

Now that we know how to use the hardware interrupt we can write routines to handle any job which we need done at a regular interval. Would you like to do sound effects or screen background motion? Would you like to do a screen dump to your printer whenever you hit a certain key? Use your imagination and all kinds of possibilities may be revealed. □

PROGRAM DISKS
AND CASSETTES

Ahoy! uses only
maxell
premium quality disks.

We're sure you're looking forward to trying out the programs in this issue of *Ahoy!* But we're equally sure that you're *not* looking forward to typing them in. If you're an average typist, that should take you upwards of 25 hours. Not counting time spent correcting your typing errors, of course. How long that will take is anyone's guess.

- How would you like someone to type the programs for you? At a price of, say—32¢ an hour? Wouldn't it be worth 32¢ an hour to free yourself up for more pleasant pursuits—like enjoying the rest of your *Ahoy!* magazine?
- If you order the *Ahoy!* Program Disk or Cassette, you'll be getting that service for just under 32¢ an hour. Because for \$7.95 (postage included)*, we'll mail you all the programs in this issue, on a disk or cassette that's tested and ready to run with your C-64 or VIC 20. If you subscribe, you'll save even more: 12 monthly disks or cassettes for \$79.95, 24 for \$149.95 (postage included)*. Back issues are available as well.
- You already know how to type. Why not use the hours you spend with your Commodore to learn something new?

*Canadian and foreign prices higher.

RUPERT REPORT

ASSEMBLER ESCAPADES

Putting Assembly Language Routines into BASIC

By Dale Rupert

Are you curious about those BASIC programs that contain line after line of numbers in DATA statements? Perhaps you know that somehow all of those numbers represent a machine language program. If you've wondered where the numbers came from in the first place, just keep reading. Enlightenment is close at hand.

This month we will continue last month's work. We will use an assembler to create a machine language program. Next, using a disassembler, we will look at that program in memory. Finally we will convert the machine language instructions into the DATA statements of a BASIC program.

If this is your first experience with assembly language, this article will be at least a two-pass process. I strongly recommend that you read it through first for an overview of all the concepts, then reread it at least once to study how the pieces fit together.

Last month we discussed the Kernal routine called SAVE. We used SAVE from within our BASIC program to put a specified portion of memory onto a disk program file. Specifically, we wrote a program to store the machine language portion of DOS 5.1 ("the Wedge") onto any diskette. We also discussed the modifications required to save a screen image onto a disk.

This month we will work with a program to save both the screen memory and the color memory data of the Commodore 64 onto separate disk files. We will start with last month's BASIC subroutine to access the Kernal SAVE routine. Then we will edit, assemble, and disassemble a machine language program to replace that BASIC subroutine. Have a look at the main program in Listing 1 (see page 91).

Lines 150 through 330 access the Kernal SAVE routine, as we discussed last month. They form a subroutine which is called from lines 60 and 90. When this subroutine is called, SADDR and EADDR contain the starting address and ending address respectively of the portion of memory to be written to a disk program file. The file's name is specified by the variable FLNAM\$. The OPEN statement in line 230 replaces the SETLFS and SETNAM Kernal routines which are prerequisites for the SAVE routine. Review last month's article or refer to the description of the SAVE routine on page 293 of the *Commodore 64 Programmer's Reference Guide*

(PRG). This is the subroutine that we will replace with a machine language program.

We will come back to lines 1 and 2 of Listing 1 later. Lines 10 and 20 define the functions which calculate the most significant byte (MSB) and the least significant byte (LSB) of any integer X. Line 30 calls the subroutine at line 500 which puts a fancy design on the screen.

Lines 40 through 60 define the variables required for the SAVE routine. The filename of the screen memory is @:SCRN1. The "@" will cause any previous version of SCRNI to be erased before the current screen data is saved as an updated SCRNI. This is handy for debugging so that you don't have to repeatedly define new filenames every time the program is run. On the other hand, when you use this program to save your own screen images, you will want to use a new filename for each screen image.

Before putting an image onto the screen, you could use INPUT statements to specify the filename for the screen memory and the color memory. You might add lines 26 and 27 as follows to do this:

```
26 INPUT "CREATE WHAT SCREEN FILENAME?";  
   FS$  
27 INPUT "CREATE WHAT COLOR FILENAME?";  
   FC$
```

You would then replace lines 40 and 70 with these lines:

```
40 FLNAM$ = FS$  
70 FLNAM$ = FC$
```

The additional statements to restore the screen image are in lines 100-140 and line 600. Line 110 clears the screen image which has just been saved to disk. Line 130 sets a flag QQ to 1. We'll see why in a moment. The color memory filename is stored in FLNAM\$, and the program jumps to line 600. Line 600 loads the data from that file back into the memory location whence it came (because of the ",1" at the end of the LOAD statement.)

After the LOAD statement is done, BASIC behaves as if a GOTO 0 were next, and execution resumes at the start of the program. In line 1, the value of QQ is tested and seen to be 1, so the program branches to line 140. When this program is run for the first time, the value of QQ is 0. Consequently lines 1 and 2 are by-

passed initially.

At line 140, the QQ flag is set to 2, and FLNAM\$ is given the value of the screen memory filename. Line 600 loads the screen file data back into the proper area of memory which is now at locations 1024 through 2023, and the image reappears on the screen. As before, execution continues from the beginning of the program. Since QQ now has a value of 2, line 2 causes the program to end. If you wish to do something else with this screen image, simply modify line 2 to jump to your own routine.

THE ASSEMBLER

Our next goal is to write an assembly language routine to duplicate the functions of the BASIC statements in line 240 through 310 of Listing 1. First you must have an assembler program. I used the *IEA Instant Editor Assembler* from Robin's Software (Bloomington, MN). It is a reasonably priced editor, assembler, and monitor package that is self-contained and relatively easy to use. If you are using another assembler, the procedures in the following discussion will be very similar.

The *IEA* assembler does not require a separate editor program to create the assembler source file. Instead it adds some commands to the BASIC screen editor. Thus you create an assembly language routine much the same way you do a BASIC program. Simply type each assembler statement on a separate line. Although *IEA* allows the BASIC and assembler routines to be contained within the same file, we will create the assembler routine separately.

Look at the statements in Listing 2 (page 92).

With the exception of the periods at the start of each line, lines 210 through 340 were typed just as shown. (Lines 10 through 30 and the initial periods on each line were added later in order to create the magazine listing.)

The assembler takes this "source code" which consists of somewhat Englishlike statements and translates it into "object code" which is the actual machine language numbers that the processor understands. Some of the statements in this source code translate directly into machine code, while others are special instructions for the assembler, called "pseudo-ops."

First we will discuss the 6510 microprocessor instructions in the source file. Then we will look at the pseudo-ops. Pages 232 and 233 of the *PRG* list the 6510 instruction set. Using that list, you can see that lines 230 and 260 through 320 of the source listing contain actual 6510 instructions.

Line 230 tells the processor to **JuMP** to the line labeled `":ENTRY"`. Each label is preceded by a colon. The line numbers in Listing 2 have been chosen to correspond as much as possible to lines performing similar functions in Listing 1.

The accumulator is frequently used as an intermediary since the 6510 microprocessor cannot directly move data from one memory location to another. Line 260 loads the accumulator (LDA) with the value stored in

the memory location labeled `":SADDR"`. Line 265 takes that value in the accumulator and stores it (STA) directly into memory location \$FC, which, you may recall from last month, is a page-zero location available to us. The "\$" indicates a hexadecimal value. Similarly the value in memory location `":SADDR + 1"` is loaded into the accumulator and then stored into page-zero location \$FB in lines 270 and 275. (We will see what those memory values are a little later.)

Line 280 is a "load immediate" instruction as indicated by the "#" in front of the \$FB. Rather than treat the \$FB as an address as it did with `":SADDR"` above, the microprocessor will put the value of \$FB directly into the accumulator.

Lines 290 and 300 take whatever values are in memory locations `":EADDR + 1"` and `":EADDR"` and load them (LDX, LDY) into the X and Y registers. Glance back at Listing 1, and see that these assembly language instructions duplicate the functions of the BASIC instructions in lines 260 through 300.

The JSR instruction in line 310 is comparable to a GOSUB statement in BASIC. It tells the processor to call the subroutine whose address is stored in the memory location labeled `":SAVE"`. You can see that the assembler memory location labels are analogous to variable names in BASIC.

At the end of the Kernal SAVE routine is an RTS (Return from Subroutine) instruction which transfers control back to our program at line 320. The RTS instruction in line 320 returns control back to BASIC. Notice that Listing 1 doesn't need such a statement since the SAVE routine returns directly to BASIC. Listing 2 creates a machine language program which calls another machine language Kernal routine, whereas Listing 1 is a BASIC program that calls the Kernal routine.

PSEUDO-OPS

The instructions in Listing 2 that we have not yet discussed are the pseudo-ops. They look somewhat like assembly language mnemonics (LDA, RTS, etc.) but they are not among the instructions recognized by the 6510 microprocessor. The pseudo-ops are instructions to the assembler.

The ORG (Origin) instruction tells the assembler where the program is to reside in memory. We've chosen \$C000 for the start of our routine. The next pseudo-op is the .EQ (Equate) in line 240. This is equivalent to the LET statement in BASIC. It assigns the value \$FFDB to the label `":SAVE"`, just as we did in line 240 of Listing 1. The .EN instruction in line 340 tells the assembler where the end of our assembler source code is. These three pseudo-ops do not actually cause any data to be put into memory.

The pseudo-op .DB (Define Byte), on the other hand, does cause data to be stored in memory. The location in memory for the first of the two bytes \$04 and \$00 will be referred to by the label `":SADDR"`, and `":EADDR"`

identifies the memory location of the first of the two bytes \$07 and \$E8. The second bytes are at (:SADDR + 1) and (:EADDR + 1) respectively.

If we were to assemble this program by hand, we would have to figure out how many bytes long the JMP instruction in line 230 is in order to know where in memory the \$04 and the \$00 will reside. The assembler takes care of that for us. It allows us to refer to the memory locations by means of the labels we have chosen. Consequently we don't even need to know the actual numerical values.

Since assembly language is a lower-level language than BASIC, comments are even more crucial for debugging and for figuring out tomorrow what the routine you wrote today was supposed to do. A semicolon defines the start of a comment in the source code. Anything after the semicolon on a line is ignored by the assembler.

Right now you may be wondering what we do with the source code we've created. First we save the source code just as we would save any BASIC program we have typed in. Then we assemble it.

With the *IEA* assembler, the instruction *.A* puts the assembler into action. The mnemonics are translated into their numeric values. The values following the *.DB* pseudo-ops are inserted in their proper places. Also a symbol table is created which shows the numeric values assigned to each of the labels. Typing *.X* with the *IEA* assembler displays a symbol table as shown in lines 40 through 70 of Listing 3 (page 92).

Notice that :SADDR begins at \$C003. The ORG statement specified that our program was to begin at \$C000. From this we can conclude that the JMP instruction requires three bytes, residing from addresses \$C000 to \$C002. The label :END has a value \$C01D, so our program will occupy memory locations \$C000 through \$C01D. Actually the *.EN* pseudo-op creates a \$00 byte at location \$C01D which corresponds to a BRK (Break) instruction. Refer to page 256 of the *PRG* to see the hex values (called the op-codes) of all instructions.

Now that we have edited (created) and assembled this program, we can save it to disk as an executable file if we wish. Using the *.S* command saves a specified range of memory under a filename that we choose. The program saved is called the object code. In order to see what the object code looks like, with the *IEA* assembler we must use a separate monitor program.

THE MONITOR

A monitor program allows you to readily peek at data and instructions stored in memory. A monitor will typically contain a disassembler which translates the numbers it finds in memory back into the mnemonics that we used with the assembler. Generally a disassembler cannot create labels since those are not stored in memory as part of the object code. (A symbolic debugger will allow you to assign labels and refer to them during debugging, but we won't use one here.)

Listing 4 (see page 92) shows the result of disassembling our object code as it resides in memory.

I have added the numbers in the left column for the magazine listing. They correspond to the numbers in Listings 1 and 2. The disassembled object code is in essence what the microprocessor sees when it executes our program (yes, we know the values in memory are really 0's and 1's rather than hexadecimal, but binary is too cumbersome for our brains).

The second column of numbers indicates the memory addresses where each instruction resides. The next one, two or three hex values are the op-codes for each instruction. The last columns contain the mnemonic instructions corresponding to the op-codes.

For example, beginning at memory location \$C000 are the three bytes \$4C \$07 \$C0. When the processor sees the \$4C instruction, it recognizes it as a JMP statement. The processor expects the next two bytes to represent the address to which it will jump. Those two bytes are stored in the LSB, MSB format we have already discussed. Consequently the processor jumps to address \$C007 in order to fetch its next instruction.

Some instructions are only one byte long (RTS) and others may be two or three bytes long. Part of the processor's job is to determine from the op-code how many bytes make up each instruction. If you glance at the description of the LDA instruction on page 245 of the *PRG*, you will see that it may be either a two or three byte instruction. How does the processor know? Very simply, each form of the instruction has a separate op-code.

Op-code \$A9 implies a two-byte instruction, and op-code \$AD is part of a three byte long instruction. The assembler mnemonic is LDA in both cases, but the processor sees them as two different instructions. In the first case (line 280 in Listing 4), the processor treats the next byte (\$FB) as data which is immediately loaded into the accumulator. In the second case (line 270), the next two bytes (\$04 \$C0) are treated as an address (\$C004) from which the processor retrieves a byte of data to be stored in the accumulator.

The disassembler treated our data in locations \$C003 through \$C006 as if they were op-codes. The \$04 and \$07 are not valid op-codes whereas \$00 and \$E8 just happened to be valid. These values correspond to the screen memory starting and ending addresses that will be used by the Kernal SAVE routine. Our BASIC program will POKE the correct data into these memory locations before this program is executed. The processor will not mistakenly execute this data since the JMP instruction at \$C000 branches around it.

To test your understanding of this disassembly listing, see if you can figure out what value will be loaded into the Y register when the instruction at memory location \$C016 is executed. If you said \$07, you are correct. LDY \$C005 tells the processor to take the value from location \$C005 and put it into the Y register. According to line 253, the value in location \$C005 is \$07.

An integrated business software package for the C-64™ for \$1.59 a Program? Yes.

The Intelligent Software Package for **C-64™**, **VIC™**, **SX-64™**, **Plus 4™**, **16™**, **'B'-Series™**, and **PET/CBM™**. No games, no fancy packaging, and you can't buy it anywhere but here. But: 22 powerful, useful programs (totalling over 51 pages of source code) that will put your Commodore to work right now, in your home or office; all on disk or tape at the ridiculous price of **\$35**. Includes:

Database: A complete multi-keyed fixed-record-length data base manager. Sort or select (using all relational operators: =, >, < 2, AND, OR, NOT, wild card) on any field, perform computations on numeric fields. Any operation can be performed on all, or only selected records. All fields completely user-definable. Can be used for any number of tasks, including accounting, mailing lists, inventory control, record, tape, or book cataloging, expense account maintenance, or as an electronic rolodex. Even if you use your Commodore for nothing else, this program alone might justify its expense.

Word Processor: The original word processor for the VIC-20, W/P is now available for all CBM models. A full-featured menu-driven word processor including very fast file commands (including a disk catalog), screen editing, text locating and full control over margins, spacing, paging, indentation, and justification. "... well done and highly functional ... Provides an excellent alternative to the high priced word processors ... this is an excellent buy. Highly recommended." — Midnite Software Gazette. "Provides good basic features." — Computer's Gazette.

Copycalc: An electronic spreadsheet. Turns your Commodore into a visible balance sheet; includes screen editor. "Excellent program for budgeting, estimating, or any math-oriented use ... well worth the money. Highly recommended." — Midnite Software Gazette.

Also Included: **ReportGen**, **ReportMerge** (interface W/P with Database to create form letters, statements, invoices, mailing labels, other reports.); **Baseball Statistician** (compiles batting statistics for a baseball league); several W/P utilities, including **Index** (indexes W/P's text files); several Database utilities, including **DBmerge** (facilitates multi-file database applications.), **AND DBStat** (analyzes D/B files); a programming utility, **ASCII**, which converts text files (program listings) into program files; also **Checkbook**; **Inventory**; **Paper Route**; **Loan Analysis**; **Breakeven Analysis**; **Depreciation**; **Labeler**; more.

Versions of the package are available for any and every Commodore computer having a minimum of 10k RAM (does it say 'Commodore' on it? How about on the box it came in?) Add \$3 if you have an 8050 disk drive. All programs will fully support tape, disk, and printer. The package is available on disk or tape (disk version only for Plus4™ and 16™.) Price includes documentation and shipping within USA and Canada; all other countries, add \$5 (no personal checks from outside USA). No charge cards. For C.O.D., enclose \$5 fee; Calif. residents add 6%. This ad is the catalog.

HOT ACCOUNTS™

The most highly acclaimed
bookkeeping system
for the Commodore 64®

Superb!
An exceptional program that
outshines all others.

RUN Magazine, Nov. 1984

HOT ACCOUNTS™ teaches you bookkeeping as it automatically performs dozens of full-service accounting functions. It is a complete system that will instantly organize your records and receipts and supply charts, formal statements, and budget information. Now your records can be accurate, up to date and confidential. ■ Tracks charge cards, checkbooks, all transactions ■ Requires no prior knowledge of accounting ■ Home or small business ■ Improves your financial image ■ Cost less than 1 hour with a C.P.A.

HOT ACCOUNTS™ Bookkeeping System on Diskette

For **RUSH** delivery, send check or money order for \$64.95 to:

VISA MASTERCARD

P.S. Use HOT ACCOUNTS™ to do your taxes and the price is tax deductible!

BONUS OFFER! Order before **July 15th** and receive a full featured, 60 function **word processing & 3-D business graphics** package as our **FREE** gift to you.

Reader Service No. 229

Now what value will be stored in page-zero location \$FB by the instruction at location \$C00F? If you said \$00, you're right! Notice that the accumulator contained the value which it got from \$C004 in line 270. The value in \$C004 is \$00.

BACK TO BASIC

We can now modify our original program to implement the machine language routine we've just discussed. From the disassembler output, we easily create the DATA statements in Listing 5 (see page 92). The statements in Listing 5 will replace the corresponding lines in Listing 1.

The data is POKed into memory by the statements in lines 190 through 220. Once that is done, memory locations \$C000 through \$C01C look the same as they did after we assembled our source code. The first time this subroutine is called (by line 60), the machine language data is read and stored in memory. The second time it is called (by line 90), lines 190 through 220 are bypassed.

Lines 240 through 290 put the appropriate screen or color memory starting and ending addresses into the proper RAM locations (which we determined from the symbol table in Listing 3 and from Listing 4).

Finally the SYS statement in line 310 sends the processor to our machine language routine at address 49152

(\$C000) where the specified memory data is written to a disk file. As in Listing 1, the filename is established by the OPEN statement in line 230.

There is really no advantage to using the machine language version of this subroutine compared to the BASIC version. The machine language version has been written to exactly duplicate the BASIC one. The Kernal SAVE routine takes the same amount of time to execute regardless of which routine calls it, so we have no speed advantage in this particular case. This has been primarily an academic exercise.

Hopefully you now have a better understanding of how machine language routines may be incorporated into BASIC programs. Perhaps you have learned something about editing, assembling, and disassembling. This article has provided a model which may be useful for creating and calling your own machine language routines from BASIC. If nothing more, at least you have two versions of a program for saving and restoring screen images on disk.

The IEA Instant Editor/Assembler is \$39.95 + \$2 p&h from Robin's Software, 10349 Zinran Circle, Bloomington, MN 55438. Mark Robin mans the assembly language hotline at 612-944-8654 from 6 to 10 p.m. (CST) seven days a week to assist Commodore 64 assembly language programmers. □

SEE PROGRAM LISTINGS ON PAGE 91

R A I D

For the C-64

By Larry Coats, with Noel Nyman

You are making a raid on Heartland to capture as many hearts as you can. But beware of the butterflies. One touch and you'll lose one of your lives. Touch too many and you lose the game.

This game uses a joystick to move a playing piece through a simple maze, capturing hearts by touching them. Floating around in the maze are butterflies. You must avoid them and collect all the hearts to exit from the maze. If you make it, you score extra points and get a new maze.

Up to nine people can play, taking turns with the joystick. There are nine levels of play as well. The game may seem simple at first. But looks can be deceiving! Machine language is used for the maze action to provide fast movements and quick joystick response.

Two programs are used to LOAD and RUN *Raid*. Type in the *Disk Boot* on page 94 if you use a disk drive. Use *Cassette Boot*, also on page 94, if you have a datasette. Then type in the main listing. SAVE the pro-

gram with the name *Raid* so the boot program can LOAD it properly.

Since there are many DATA statements, we've included a "checksum" to help you detect any errors in typing. The last number in each DATA line is negative. Be sure to type in the minus sign.

When you first RUN *Raid*, you may see an error message on the screen. The message will identify the line number of a DATA statement that has an error. Once you've found all the errors, the program will display the maze and ask you for the number of players and level of difficulty.

You can remove the REM statements in lines nine through twenty-five if you wish. Line #2140 displays the updating address on the screen during the machine language load. The program will LOAD faster if you leave out the two PRINT statements on this line. Don't take out the POKE statement!

We hope you enjoy this simple but challenging game. □

SEE PROGRAM LISTING ON PAGE 94

DOS PLUS

Continued from page 39

than the start of BASIC. For instance, you might have a hi-res screen you wish to save, or a block of sprite data that you want to write directly to disk. Give your data block a filename, enter its starting address and ending address+1, and *Dos Plus* will do the rest. No more loading a monitor to save machine language programs! You may reload such saved files by typing LOAD "filename",8,1 <return>. You could even save BASIC ROM itself, if that were your passion. Notice that the file saved is automatically verified for you.

This one is used several ways:

*FILENAME <RETURN>

or

*"FILENAME" <RETURN>

or by entering the asterisk directly in front of a filename in a directory listing. This is the SINGLE-FILE COPY command structure. After entering it, you will be prompted for a destination. Single drive users should respond by entering '8'. The file will now be copied into memory from the disk that is presently in the drive without overwriting any program you might have in memory. The size of file that may be copied is limited only by the amount of memory available between the next even page boundary above the end of any program in memory and the top of BASIC. If, during the copy process, the file exceeds the top of BASIC high memory, the copy will abort with 'FILE TOO BIG.' If you are going to copy a very large file it would be wise not to have a program in memory at the time of copy. After the entire file has been brought in from disk you will be asked to insert the destination disk and press RETURN. The entire file will then be written to the destination disk. The file will be auto-verified at that point (unless you have defeated that function). If you wish to abort the copy process, you can do so by pressing RUN/STOP at the 'INSERT DESTINATION DISK' query. Do not attempt to copy relative files with this function. Sequential, user, and program files may all be copied but will be written as program files. If you use this function to copy a non-program type file you may use the @:D (block dump/modify) command to change the file-type identifier in the directory. If you are using two disk drives you may enter '9' to the 'TO ? 8/9' prompt. Be careful that drive '9' is present or the computer will 'hang.' After the copy process is complete you will be logged to drive 9.

Since drive logging has been mentioned, note that if you are using two disk drives, one as drive 8, the other as drive 9, you may use *Dos Plus* to work with both. To change the drive you are currently logged to, enter:

@8 <RETURN>

or

@9 <RETURN>

as appropriate. After logging to a given drive, all future disk operations with *Dos Plus* will be performed on that drive. To work with the alternate drive you must log to it with the correct @ <number>. Also note that this is automatically done when you use the copy function (*) and enter the appropriate drive number to the 'TO ? 8/9' prompt.

Want to verify a program that is at a location other than the start of BASIC? Type:

@:V 'FILENAME', \$ <START ADDRESS> <RETURN>

This is primarily useful if you have disabled the auto-verify function of *Dos Plus*. Since verifying large saves can be time consuming, you may wish to disable the auto-verify on saves or copies from within *Dos Plus*. You do this by changing the DOS.BOOT program which loads DOS PLUS. Alternately, you may POKE the appropriate location as is listed in Table 1. The @:V (verify) command enables you to verify saves or copies as you see fit.

Some additional commands:

@ — Read disk error channel

Dealer Inquiries Invited

MAIL TO:

microcomscribe

8982 Stimson Ct., San Diego, CA 92129
(619) 484-3884

Reader Service No. 185

/filename — Load a program at start of BASIC
 %filename — Load a program at its load address
 ←filename — Save a program from start of BASIC
 (will auto-verify unless disabled)
 ↑ filename — Load & Run a program at start of
 BASIC
 #<nnnn> — Give hex number for decimal input
 \$<nnnn> — Give decimal number for hex input
 @Q — Disconnect *Dos Plus*

These commands work as they do in previous Wedge programs. The hex and decimal number conversions use 16-bit arithmetic, meaning that the largest values returned are 65535 and \$FFFF respectively. Right justification is used for hexadecimal input. This means that \$ABCDE will be taken as \$BCDE, etc.

For the hard to please among you and the true hacker types, three command structures have been supplied that are null routines. These are: @:1, @:2, and @:3. All three merely print a carriage return and jump to BASIC at \$E386. You may revector these commands to your own custom routines by changing the last three jump addresses at the very end of the *DOS Plus* machine language to the addresses of your routine. Characters entered with these commands will be in the system input buffer at \$0200 and are terminated with a zero byte. Your routines should return to BASIC with a JMP \$E386 instruction, not an RTS to DOS PLUS.

The DOS.BOOT program contains several POKES that are user modifiable. These addresses and their functions are outlined below.

POKE 53230,001 : 1=auto-verify 0=don't auto-verify
 POKE 53012,008 : default drive at power-up
 POKE 51329,096 : 96=UPPER CASE Printer Sec. Addr.
 103=lower case Printer Sec. Addr.
 POKE 53040,018 : 18=reverse video on directory header
 146=no reverse video
 POKE 53063,018 : same as above
 POKE 50999,144 : color of hex numbers in DUMP/MODIFY
 POKE 51069,144 : same as above
 POKE 51057,005 : color of ASCII digits in DUMP/MODIFY
 (this combination looks best on my amber
 Taxan. Alter to your tastes—use ASCII num-
 ber for color code, not Commodore color
 codes, i.e., 5=white, 28=red, 144=black,
 etc.)

By POKEing these locations you can, with the appropriate values, alter *Dos Plus* to your own tastes. Any, or all, of these locations can also be changed directly from the keyboard should you so desire. Merely POKE the location with the value you wish to substitute. This will save you from having to run the loader program to make the changes.

Well, there you have it—a balanced set of tools all wrapped in one tight package that won't steal precious space from your BASIC programs. Since *Dos Plus* takes up all but two of the locations at \$C000 - \$CFFF, you will most likely find a conflict in memory usage with some other utility that you like to use. Experienced machine language programmers will be able to get around this by relocating these utilities and patching them to *Dos Plus* with the supplied hooks. If it is beyond your present programming skills to implement such a patch, you will find the inconvenience to be more than outweighed by the usefulness of *Dos Plus*. Who knows? After a time you may wonder how you ever got along without it! Shortly after I wrote *Dos Plus*, I completely destroyed the directory tracks on a CP/M disk on which I had the only copy of a compiler I was writing. Using the BLOCK DUMP/MODIFY function of *Dos Plus*, I was able to reconstruct the directory tracks and thus recover three months' worth of work.

Writing *Dos Plus* has been an educational experience for me. I hope that using it will prove to be a pleasurable and educational experience for you.

For those who wish to patch their own machine language routines to *Dos Plus*, or are merely curious or want to learn more about assembler, I will supply copies of the source code for *Dos Plus*. Since this amounts to over 30 pages of heavily commented hardcopy I will have to ask that you help cover the cost of paper. Send \$1.50 and a self-addressed, stamped manila envelope to: Dennis Muscatelli, R.D. #1 Box 543, Morrisdale, PA 16858.

I wish to express my deepest thanks to Professors William Englebret and Gene Schlossberger at The Pennsylvania State University for their critical comments and assistance with debugging. □

ON-COURT TENNIS

Gamestar

Commodore 64

Disk, joystick; \$29.95

Anyone who doesn't think computer games have come a long way since *Pong* ought to try a few sets of *On-Court Tennis*. It's hard to imagine two games based on the same sport being more different.

On-Court Tennis features fluid animation, highly sophisticated computerized opponents in the solitaire mode, and true-to-life strategy. It's a far cry from rectangular racquets hitting a square "ball." In fact, the hardest part about learning to play this sports simulation is the way it shatters preconceptions.

The most radical change is that the joystick is used to select the desired stroke, not move the athlete around the screen. In effect, *On-Court Tennis* is a strategy, as opposed to an action, game.

The display shows the court in three-quarter perspective, with the serving player at the bottom of the screen. As the onscreen character tosses the ball into the air, the computerist moves the joystick to start the volley. The direction in which the stick is pushed determines the placement of the shot. Hitting the action button produces an especially hard serve.

The computer automatically positions the racquetteer into position to return a shot. The main challenge, therefore, is timing the swing and choosing the specific stroke. The gamer can pick a flat shot, lob, top-spin shot, slice, or drop shot. Whether the ball goes left, right, or straight ahead depends on when the player swings.

The meticulously accurate ball-shadow isn't just window dressing. It's the principal guide to timing a racquet stroke. This can be tricky, since the shadow is in a different position, relative to the ball, depending on whether the onscreen player

On-Court Tennis: an outright winner.

READER SERVICE NO. 191

is in the far court or the near court.

Four robot foes are ready to battle the computerist in a single set or a three- or five-set series. Each opponent has strengths and weaknesses

vary their skill as the human player gains mastery of the game.

The playing surface also affects the difficulty level. The ball bounces true on a hard court, goes faster on grass, and slows on clay.

Novices are strongly urged to begin by trying one set on clay using the baseliners. *On-Court Tennis* is a very demanding game even at its easiest setting, and the first few rounds of play are bound to be error-filled and highly frustrating. This is one game that definitely repays the investment of a couple of practice sessions. If all else fails, watch the com-

Fleet System can check any document against a 70,000 word dictionary on the flip side of the disk (without exiting the program) and highlight all suspect words.

READER SERVICE NO. 192

and favors a particular style of play. "Ivan Messier," for example, plays the baseline and boasts a terrific serve. "Jimmy Orr," on the other hand, roams the entire court and depends most heavily on a superb forehand. All four are programmed to

Trolls and Tribulations (see page 71).

READER SERVICE NO. 193

puter play itself to get some hints.

On-Court Tennis is truly a landmark computer entertainment program. It takes a fresh look at a subject, video tennis, which many considered totally played out. This outstanding disk proves them wrong.

Gamestar, 1302 State Street, Santa Barbara, CA 93101 (phone: 805-963-3487).

- Fast Save Load Verify
- Fast Scratch and Validate
- 10 Second Format with Verify
- No more Drive Head rattling during Format or Error Reading
- also Save with Replace is Improved
- Two times faster, Eight times faster when used with Turbo 64 which is included
- 1541 Super ROM is 100% Compatible
- Easily installed in Minutes

APALLO COPIES IT ALL

APALLO Does it All. This program is the latest generation of copy programs. It will do everything the \$39.00 and \$49.00 programs will do and **more**. It Copies **ALL** drive errors, bad tracks and sectors, non-standard format, bad syncs, and half tracks. We feel this is the best program of its kind available...

\$29.95

MSD Sure Copy

At last a complete utility package for the MSD Dual Drive. This is the first MSD utility program that does it all. The main menu options include:

- Copy Protected Disk
- Copy Files
- Format a Disk
- Change Disk Name
- Quit
- Copy Unprotected Disk
- Scratch a File
- Rename a File
- View Directory

\$39.95

Sure Copy will put all errors automatically on disk: 20, 21, 23, 27 and 29's.

D-CODER

- Translates any machine language program into easy-to-read English descriptions with complete explanations of each command!
- Makes complete notations of all important memory locations accessed by the program! (SID, VIC, MOS, KERNAL, etc.)
- Gives you three ways of accessing programs:
 - 1) Will read and list programs from DISK
 - 2) Will read and list programs from MEMORY!
 - 3) Direct user input (from magazines, etc.)
- Can be used to locate and examine any machine language program's protection routines!
- Can be used to easily break apart machine language programs for study and examination!
- Printer option for complete hard copy listings!

\$19.95

You no longer need to be an EGGHEAD to read Machine Language.

N-CODER

\$19.95

the machine language manipulator...

The perfect companion program to D-CODER!

Allows you to easily make changes in machine language programs... right on the disk!

- Rewrite ability allows code to be altered and then rewritten directly to the disk!
- Features sector-by-sector scrolling assembly language display of machine language programs!
- Notation of ASCII text equivalents for easy spotting of embedded text strings!
- Handy reference display of all assembly language commands and their ML numerical equivalents!
- Byte splitter for easy splitting of decimal addresses into low byte-high byte format!

C-64 Label Maker

Choose one to one million labels...

\$14.95

- On-line Instructions
- Allows Fall Editing
- Works with all Standard Printers
- This Program will even put your Disk Directory on Labels for you

SOFTWARE PROTECTION HANDBOOK

**3rd
Edition**

THIRD EDITION! NOW AVAILABLE!

If you're tired of being harassed by protected software and too many copy programs, then this is the book for you! This 224 page manual covers the gambit from legalities to protection methods to step-by-step back up procedures. Now you can learn both how to protect and unprotect software! The techniques covered include copying cartridges to tape or disk, tape protection, and disk protection. Disk protection covers error no.'s 20, 21, 22, 23, 27 and 29 plus single track formatting, header modification, header swapping, half track reading and writing, reading and writing modified bit densities, formatting illegal tracks/sectors, sync writing and more! The Third edition explains, tells how to detect and how to write them with included software. Eleven useful utilities and many protection listings! Our disk analysis programs reveal the protection methods used on your originals. A diskette with all software is available for a minimum extra charge. This may not be the only book you should have for the C-64, but it is certainly the one book you should not be without!

WordPro was among the first office quality word processors for the C-64. Their latest entry, *Fleet System 2*, easily outclasses *WordPro*, for it packs an onboard spelling checker and several other distinctive features that are handy in an office environment.

Business users will appreciate the choice of viewing a 40-, 80-, or 120-column display. (The screen scrolls horizontally when you're keyboarding in the wider modes, which are excellent for preparing heavily tabulated reports.) A setup program that is run prior to the first time you use the word processor allows you to pick the colors of the screen's border and background as well as the text. Regrettably, the display lacks automatic word-wrap. Words get cut off at the right column and are continued on the next line, which restricts onscreen readability. There is one consolation. When working in 40-column mode, you can "preview" the document and see a vertically scrolling 80-column display of the document's ultimate appearance and the effects of all formatting commands. (You cannot write and edit while previewing, however.)

While composing this review with *Fleet System 2*, I was considerably dismayed to see some of my snappiest sentences abruptly vanish into the Twilight Zone. Whenever I pressed the return key while the cursor sat on an existing line of text, everything between the cursor and the right side of the screen disappeared. My spirits were soon lifted, however, by the discovery of a feature called the "extra text" area, which accommodates as many as 450 screen lines of text that can be manipulated in several practical ways. While learning the system, for example, you can load a "help" file into this area and flip back and forth between your ongoing document and a list of commands and functions and their respective keystrokes. Frequently used words, addresses, even whole chunks of text can be kept here and inserted into the ongoing document. This is accomplished by designating abbreviations for them in the extra text area. For

this review, I reserved the letters "od" to indicate the words "ongoing document." While writing the above sentences, I merely typed the f1 key, the letter "a" (to indicate I wanted to "append" a phrase from the extra text section) and the letters "od". Text stored here can also be automatically inserted into blank space within a document, which serves to facilitate the rapid printing of personalized form letters.

When you're working in the main text area, a status line that looks like : X : F : I : S : N : reminds you of the current editing mode. The f1 or RUN/STOP key works like a clutch. Press f1 and the F lights up; then hit X to enter the extra text area. A similar two- or three-keystroke process is also engaged to conduct operations such as marking a range of lines to be copied, erased or funneled off to another part of the ongoing document. A range is marked by moving the cursor down to highlight the chosen text, but you can only highlight whole lines. If only half the line is to be transferred or erased, you must use the "paragraph split" command to shove the other half down to the next line. This is the most awkward aspect of editing with *Fleet System 2*. Another common editing operation, shifting between insert and overwrite modes, is swiftly executed by tapping the f3 key.

Cursor control is limited to hopping to the top of the screen, beginning of the document, or down to the next line. Of course, you can glide freely around the current screen via the cursor keys, but cannot skip directly to the end of the immediate screen or the document, or flip to the next or previous screenload. You can "speed-scroll" through the text, but this still isn't as useful as the ability to flip screens and is also rough on the eyes. At least it is easy to delete the next word or sentence, in which case the program highlights the text and offers you a chance to bail out before consigning the offensive text to extinction. *Fleet System's* formatting commands look familiar: one or more lines contain marks such as lm5 (left margin is set for five spaces),

which can be embedded throughout a document to change centering, justification, and other formatting features. Underlining and other printer-supported features can be addressed, and you may even indicate Spanish accent marks if using a dot matrix printer. (Compatible printers are listed in the setup program's menu and encompass a range of twenty-three popular machines including the FX-80, TTX, Gemini, Brother, Okidata 82, TP-1, and the Commodore printers.)

Fleet System's major selling point, a 70,000 word dictionary, is on the opposite side of the program disk and can be accessed without exiting the word processor. It rapidly checks all the words against this dictionary and one created by the user, then highlights all "suspect" words. These may be ignored, added to the user dictionary, or corrected on the spot. (The user dictionary can hold up to 12,000 words.) After saving the document and exiting to BASIC, you may avail

yourself of some intriguing features in the options program. A frequency and statistics report will list all selected words and the number of times they appear. You'll also be informed of the number of different words, average word length, number of sentences, and other statistics that may or may not be significant to you. (You don't have to access this program for the most practical such option: two keystrokes will instantaneously summon up a precise word count at any time.)

A single document may be up to eight or nine pages in length, and files can be linked to simultaneously print a document that was broken into several files. Saving and loading files is a simple process, and the program supports one or two disk drives. Headers, footers, and page numbering, Search and Replace, mailing labels and other standard features are effectively implemented, and *Fleet System* has a couple of features that are less common. You can load sequential files saved by a database or other program, convenient for preparing the data to be used in form letters and other mail merge operations. Numeric tabs simplify aligning columns of numbers containing decimal points. While in numeric mode, you may add or subtract columns of numbers. You can also total all the numbers in a paragraph or range of lines, an unusual and creative option.

Fleet System is easy to learn and operate. The manual has a lucid tutorial for beginners; old hands will prefer to consult the index and flip to the appropriate page in the reference section. Because the program doesn't have enough cursor control "shortcuts" and makes range-setting a relatively awkward process, it is ill-suited for composing term papers, essays, or anything demanding intensive revision. *Fleet System 2*, with numerous features that emphasize business-oriented word processing, is more valuable in an office where the workload includes extensive preparation of tabulated and columnar material.

Professional Software, Inc., 51

SUPER PRINTER UTILITY PROGRAMS

Cardco, Inc.

Commodore 64

Disk; \$39.95

The newest addition to Cardco's *Cardware* software line, this disk contains such nifty entries as screen dump utilities, a banner headliner, rudimentary word processing and mailing list programs, a calculator, a screen drawing program, and a sprint print printer buffer. Also included are file conversion, BASIC program cross reference, 24K file printer buffer, and index generator programs. On the flip side is a utility for viewing the screen images also found on this side of the disk.

Ahoy!

Ahoy!

Sample screen dumps. Ahoy! logos generated with banner headline utility.

READER SERVICE NO. 195

The *Super Printer Utilities* program, the most impressive of the lot, allows you to program into the C-64's memory specific data about the type of printer you're using. It also provides several utilities for executing screen dumps, initializing and exiting keyed routines, ASCII screen dumps, reverse screens, and a host of other useful POKEs and SYS commands for using the features of the program. Once loaded, the familiar "ready" prompt appears on the screen, telling you that this data is now in memory. One nice feature is that you can specify in which block of memory you'd like to store this printer data and command sequence. You're given a choice of \$C400, \$C000, \$9400, \$7400, or \$5400. This is useful in avoiding "address conflicts" when programming in machine language. Once you've chosen the load address, the POKE values and SYS commands for that address are displayed. You're also given the option of printing this information out for future reference, if desired. For example, if \$C400 were chosen as the load address, the corresponding command list would read:

Screen Dump (Hor.).....	SYS 50176
Init Keyed Routines.....	SYS 50179
Exit Keyed Routines.....	SYS 50182
Screen Dump (ASCII).....	SYS 50185
Screen Dump (Vert.).....	SYS 50188
Reverse Screen.....	POKE 50194, S
Reverse Character.....	POKE 50195, C
Force Flag.....	POKE 50196, F
CK01 Enable.....	POKE 50197, KE
Output Mode.....	POKE 50198, OM
Device #.....	POKE 50199, DV
Secondary Address.....	POKE 50200, SA
Width (Hor.).....	POKE 50201, W
Color Mode (Vert.).....	POKE 50202, CM
User Screen Enable.....	POKE 50203, UE
Lores Start Page.....	POKE 50204, LO
Hires Start Page.....	POKE 50205, HI
Color Start Page.....	POKE 50206, CO
Prntr Type (ASCII).....	POKE 50207, PT
Non-ASCII (ASCII).....	POKE 50208, NA
2x2 Color Dots (Vert.).....	POKE 50211, C2
4x2 Color Dots (Vert.).....	POKE 50243, C4
Keypad Definitions.....	POKE 50275, KD
Utility Programs.....	50417

Examples of the screen dumps possible are shown herewith. Each of the image dumps was executed with a simple SYS command; one problem I encountered, however, was the frequent crash of the pro-

gram when trying to dump more than one screen. I was able to return to the selection menu sometimes—on most occasions, though, the screen would scroll with a “FORMULA TOO COMPLEX ERROR” message and I couldn’t recover from the crash, no matter what I did. This meant I would have to shut off the C-64, turn it back on, and reboot the program from scratch. If it only happened once or twice, I wouldn’t even mention it. But since it was the rule rather than the exception, be aware that this program has a definite tendency to self-destruct!

I’ve also included some dumps of the “BANNER HEADLINER” program contained on the disk. You’re given a choice of “Gothic” or “magnetic” type styles, and a choice of short or tall letters. Once these choices have been made, you may enter up to 254 characters of text or punctuation and dump it to your printer. Possible uses for this feature include making banners (happy birthday, welcome home, etc.) or signs for flyers (garage sale today, no parking).

The other utilities are of the “bare bones” school. The word processor has no refinements whatsoever, nor does the mailing list utility. They are useful, however, for extremely light duties.

The 44-page instruction manual is good as far as it goes, but contains an awful lot of ambiguity. A case in point is the print-dump command listing above. Take a look at the last line: “Utility Programs....50417.” Is that POKE 50417 or SYS 50417? While it may not seem like a big deal, if you need to access one of these features, typing in a SYS instead of a POKE may result in a crash. Another question unanswered: is it possible to dump, say, a play-screen from Zaxxon? It probably is, but I don’t know how—the documentation fails to make any mention of such abilities.

Users of Cardco’s *Write Now!* word processor will like the program however, since it includes utilities to convert ASCII to *Write Now!* format and vice versa. Additionally, it will allow you to convert *Write Now!* files

for transmission over a modem.

All factors considered, I was underwhelmed by the *Super Printer Utility Programs*. The crashes I mentioned and the lack of complete documentation made the disk tedious to use, and not at all up to Cardco’s usual fine standards.

Cardco, Inc., 300 S. Topeka, Wichita, KS 67202 (phone: 316-267-6525).

STAR SG-10/15 PRINTERS

Star Micronics, Inc.

SG-10: \$299; SG-15: \$499

I’ve used a Star Gemini 15X dot matrix printer for the last two years, and come to regard it as a reliable workhorse, proven through thousands of hours of use to be rugged, dependable, and flexible for a great number of applications. So when Star announced its new, improved version of the 15X, called the SG-15, I knew I had to get my hands on one and put it through the paces.

What Star has done is make a good thing even better. All the features of the older models have been retained, but enhancements have been made. Even the throughput speed has been increased by a full 20%! The added features make the SG-10 and SG-15 the printers many users have been waiting for.

The SG-10 and SG-15 are direct replacements in the company’s product line for the Gemini 10X and 15X. The difference between the two new models is the carriage size, the SG-10 having a 10” carriage, the SG-15 a 15”. (The one other difference is the 15’s 16K buffer—see below.) Since I often have occasion to use spreadsheet software and need the wide paper capacity, I chose the 15.

Externally, the SG-15 looks quite similar to its predecessor, the 15X. The function controls are of the “soft-touch” variety, replacing the push-switches of its older brother. That’s the only obvious physical difference. The other improvements are more subtle, but they show their worth as soon as you activate the printer.

The Gemini 10X and 15X were equipped with 4 DIP switches inconveniently located on the back of the

printers. These were used to select the resident character set on power-up, linefeed on or off, end of paper, and other printer functions. On the new SG-10 and SG-15, the DIP switches have been moved to a more accessible location: the left side of the printer. But in addition to making them easier to reach, 8 DIP switches have been added to the original 4. Why the extra switches? To handle the configurations for the enhanced functions, natch! And what enhanced functions they are.

The SG-15 comes with a 16K print buffer as standard equipment, double the capacity of the earlier Gemini 15X. This means that the printer itself can store up to 16K of information and hold it in memory until printed, freeing up the computer for other uses while printing continues. This humongous buffer proves its worth when using word processing software or printing out lengthy BASIC program listings. An optional buffer board is available for the 10.

Both SG models feature (as did

Uni-Kool DISK DRIVE FAN FOR COMMODORE

Designed to work with Commodore Disk Drive Models 1540, 1541, and 1542, the quiet C-100 fan enclosure moves cool, filtered air through the top vents of the disk drive cooling the drive and thereby reducing the misalignment problems caused by heat build-up. A custom filter keeps room dust from entering the disk loading opening. This greatly increases the life span of the disk drives, and decreases the maintenance required to keep the drive functioning properly. Only \$39.95 plus \$2.00 for shipping and insurance.

makes two passes for each character. (The first pass prints out the "normal" or draft-mode character, while the second pass fills in the open area between the dots and embellishes it somewhat, adding serifs and other finishing touches.) In the past, I've used the Gemini for my rough drafts and a daisy wheel for the finished product. The print quality is so good in the NLQ mode that I've become a "one printer user" again. Anybody want a used daisy wheel printer?

TROLLS & TRIBULATIONS

Creative Software

Commodore 64

Disk; \$24.95

(See screen on page 63)

Longtime joystick jolters often feel there's nothing new under the sun. Their problem is that they're looking in the wrong direction. A look under the street will reveal

Trolls and Tribulations, Creative Software's sewer-based action game featuring superb music and graphics and a veritable cesspool of activity.

Your eight-lived troll must traverse a scrolling multilevel maze, shooting cretins and eschewing skulls, buzzards, and spiders while collecting treasure. Each move must be planned with care; blindly leaping from peak to precipice will send your troll plunging into the lapping waters below. That is a fate you want to reserve for the cretins that descend from above. Your troll's shots turn them into eggs which you attempt to shove to a watery grave before they hatch.

At the onset, you choose from novice, intermediate, and expert levels of play by opening the corresponding door. Your troll then enters the first set of horizontally scrolling mazes. Locked doors appear at the end of all sections, only to be opened by the key which you acquire within the maze. Keys and treasures are collected by leaping

from ledge to ledge or dropping to lower shelves. Strategically placed trampolines will assist in reaching higher levels. Players may at first be inhibited by the need to vault moving skulls and buzzards while within low-ceilinged tunnels, but your troll cannot hit his head.

While the lower levels are quite masterable, the higher ones will prove a true challenge. The progression from easiest to hardest is gradual enough to maintain interest as ability increases.

I do have two bones to pick with an otherwise delightful game. First, there is no way to bypass earlier sections and begin deeper in the maze. Second, high score is provided, but no means of saving the information to disk (the instructions cite memory limitations). Who cares about keeping track of high score in a single sitting?

Creative Software, 230 East Caribbean Drive, Sunnyvale, CA 94089 (phone: 408-745-1655).

PFS:FILE PFS:REPORT

Software Publishing Corporation
Commodore 64

Disk; File \$79.95, Report \$69.95

PFS:File, along with your C-64, disk drive, and optional printer, forms a fairly full-featured database management system. You design the record format with full use of cursor control, delete, and insert keys. You have the top 21 lines to designate as many as 50 fields. Not enough? Hit a key and you get a

blank screen. More and more—up to 32 screens full. Be careful with those long record formats, though; if you fill out every field in a 32 screen record, only five records will fit on your diskette. Realistically, for a simple name and address file, you will be able to store about 500 records. If the addresses are short, you might even store *File's* maximum of 1000 records on your diskette. A "percent full" reading at the bottom of the screen will give you some idea of how you're doing.

From *File's* main menu, you can choose to design a new format or change an old one, add data, search through the records you have entered and update those with mistakes, print or delete records individually or in groups, or return to BASIC. As you work to create the perfect design for your records, use the Insert function cautiously. The Clear key is right next to the Insert key; hit Clear and all your design work will disappear. The designers of *File* should not have made clearing the screen so simple. When you design your second database, with a different record format, you will need to use a new diskette. If you have lots of short lists to keep, *File* can eat up your blank disks. And don't forget to format those blank data disks before you load *File*; it has no capability to format them for you.

When you want to search for a particular record, *File* can match as many fields as you specify. You can ask for an exact match (full first and last name), a partial match (a word or characters in the middle of an entry), a range of numbers (all zips from 32900 to 32950), or a "not" match (all records that do not match the search specifications). Searching for a record based on the contents of the first field will never take more than three seconds. Use any other field and the search may take much longer. *File* does not allow you to save your search specifications to disk.

Getting a printout of your records is easy. First tell *File* which records to print using the same options that are available for a search. Then tell it which fields to print from each record and whether to print each field on the same line or a new line. This option allows you to print mailing labels; however, since *File* can only print fields in order, the possible formats for your records are limited. *File* can sort as it prints, but it can only sort on one field. *File* lets you store up to eight print formats including search specifications that you can use or edit at a later time.

A critical feature of any database

Reader Service No. 216

is the ability to redesign you data files. Inevitably, you will want to add a field to each record, rearrange the fields, or delete an unnecessary field to make more room on the disk. *File* handles all these changes with no problem as long as your disk is less than 50 percent full. It is a pleasure not to have to retype dozens of records just because you have changed your mind about layout. *File* can only redesign four pages at a time, so a five page form will require two passes. And redesigning a form is slow, oh so slow.

One caveat—any new fields that are to retain their data must have labels identical to the old fields. *File* does something strange when you set up your labels (or field names); each one must end with a colon. When reorganizing a database, *File* matches every character between one colon and the next. If you have used a row of dashes to break your form into upper and lower halves, *File* will think those dashes are part

of the label which follows them. This “feature” means you may want to be very careful (read: avoid) using a heading or any other text that is not actually a field name.

Records can be deleted individually during a search or in groups. Give *File* a set of search specifications and tell it to delete; your data will disappear and free disk space will reappear. *File* numbers your records consecutively as you enter them. When some records are deleted, the others are not renumbered. Only if you redesign the form will the numbering be consecutive again. But after a redesign the records are numbered in reverse order, so you will have to redesign the database twice to have the latest records numbered highest.

File has no number crunching capability and only limited printing options. Get your wallet, here comes *PFS:Report*. *Report* takes your *File* database and lets you design and save up to eight report formats. A report

organizes your fields into columns and prints them in spreadsheet format. You can choose up to 20 fields to be printed as columns. Based on the contents of the first and second columns, *Report* can sort your data in ascending alphabetical order (A to Z) or in descending numerical order (1000 to 0). *Report* has a very powerful feature that lets you sort data based on key words in any one field. This could really automate a research project; like redesigning a form, though, it is slow.

Whatever page title you specify will be printed on each page of the report. The heading for each column will be the label of the corresponding field unless you specify some other heading. *Report* can give you the total, count, or average of any numeric column. Additionally, it can calculate subtotals, subcounts, or subaverages each time the entry in column one changes. If you just want the bottom line, *Report* will print a summary with totals only.

If that's not enough, *Report* can also calculate across rows. Say your inventory list has entries for price paid and selling price. *Report* can generate a column that shows profit (based on those two entries) for each inventory item. Up to three such “derived” columns can be contained in any report. *Report*, unlike *File*, will let you print columns in any order; they do not have to be in the same order as the fields in your database.

The manuals for *File* (24 pages) and *Report* (63 pages) are in the nice 6½ by 8” wirebound format that lays flat on your desk. The chapters match the programs’ menus, and each chapter combines a tutorial with reference information. Each manual contains a quick guide that you can use to refresh your memory once you have learned the program. Screen representations rather than actual pictures are used, so the illustrations are not identical to what you’ll see on the monitor. All the programs’ error messages are explained, but this is hardly necessary

COMMODARIES

PROGRAMMING CHALLENGES

By Dale Rupert

Each month, we'll present several challenges designed to stimulate your synapses and toggle the bits in your cerebral random access memory. We invite you to send your solutions to:

Commodares, c/o Ahoy!

P.O. Box 723
Bethel, CT 06801

We will print and discuss the cleverest, simplest, shortest, most interesting and/or most unusual solutions. Be sure to identify the Name and Number of the problems you are solving. Also show sample runs if possible, where appropriate. Programs on diskette are welcome, but they must be accompanied by listings. Also tell what makes your solutions unique or interesting, if they are. You must enclose a stamped, self-addressed envelope if you want any of your materials returned.

Your original programming problems, suggestions, and ideas are equally welcome! The best ones will become *Commodares*.

Problem #17-1: Decimalizing Dates

This problem was suggested by John Immarino (Hackensack, NJ). Write a short program to convert the string form of a date into a numerical decimal value. For example, if the user enters 1/1/85, the computer returns 1985.0000. Since mid-year is around July 1, if the user enters 7/1/83, the computer returns 1983.5000. John points out that these decimal values would be easier for performing calculations involving time periods than the string versions are. He also reminds you to adjust for leap years!

Problem #17-2: Printer Sentinel

Here's a problem sent by R.W. Kober (Buffalo, TX). Write a subroutine to determine whether or not the printer is turned on. If the printer is on, the subroutine returns immediately. If the printer is off, the subroutine displays a message such as "The Printer Is Not On." The subroutine waits until the printer is turned on, at which time it returns to the main program. This should be a tidy, unimposing subroutine.

Problem #17-3: MID\$ Statement

Some versions of BASIC contain a MID\$ statement. Commodore BASIC allows only the MID\$ function. The difference is that the MID\$ statement (pronounced "mid-string") appears on the left side of the "=" sign in an

assignment statement whereas the MID\$ function appears on the right.

Your challenge is to write a subroutine to simulate the MID\$ statement. The syntax is this: MID\$(X\$,S,N) = Y\$. The result is that some or all of X\$ is replaced by some or all of Y\$. Specifically, the first N characters of Y\$ are substituted for characters in X\$ starting at position S of X\$. The length of X\$ must not change. The value of Y\$ is unchanged. Some examples should help.

Initially X\$="RUN" and Y\$="GO". S and N are assigned the following values before your subroutine is called. The value of X\$ upon returning from your subroutine is shown.

	N=0 or N>1	N=1
S=1	GON	GUN
S=2	RGO	RGN
S=3	RUG	RUG

N may range from 0 to 255, and S may range from 1 to the length of X\$. If N is greater than or equal to the length of Y\$ or if N is 0, then all of Y\$ will be used (with the stipulation that the length of X\$ will not change).

Problem #17-4: Number Speller

The user enters a number between one and one thousand, and the computer spells that value. For example, if the user enters 12, the computer displays "twelve." If the user enters 235, the computer returns "two hundred thirty five." Anyone submitting thousand-item DATA statements will be sent to the back of the class.

First this month, a correction to the centering function described in the January 1985 edition of *Commodares*. The correct definition for FNCE is DEF FNCE(X)=INT(20-X/2). Type X=LEN(A\$):PRINT TAB(FNCE(X));A\$ to print A\$ centered on the current (40-character) line. Thanks to Milton Powell and Daniel Miller for pointing this out.

As promised last month, we have solutions to *Problem #16-2: Quick Decimal* from the originators of the problem. Programs from Jim Speers (Niles, MI) and John Prager (Bay City, MI) are listed below:

```
1 REM PROBLEM #16-2 : QUICK DECIMAL
2 REM SUBMITTED BY JIM SPEERS
3 REM
10 INPUTN$:FORI=1TO4:A=ASC(MID$(N$,I,1))
```

```
-48:T=T+16^(4-I)*(A+7*(A>9)):NEXT:PRINTT $
```

```
1 REM PROBLEM #16-2 : QUICK DECIMAL
2 REM SUBMITTED BY JOHN PRAGER
3 REM
10 INPUT H$:N=0:L=LEN(H$):FOR J=1 TO L:A
$=MID$(H$,J,1)
20 K=VAL(A$)-(A$>"9")*(ASC(A$)-55):N=N+K
*16^(L-J):NEXT:PRINT N
```

Jim's solution has the advantage of being a one-liner, but four hex digits must always be entered. John's program allows hexadecimal values of any length to be entered, at the expense of an additional program line.

By far the most popular *Commodore* in January was *Problem #13-1: Starred String*. The two most general categories of solutions are a) screen and printer compatible and b) only screen compatible. Programs which used cursor movements are of course not usable for direct printer output. The award for most unusual solution goes to Michael Hommer (Waukegan, IA) for his program written in COMAL. Here's what it looks like:

```
INPUT AT 2,4,35: "type in the string : "
; instr$
star'string(instr$)
```

```
// Procedure
```

```
PROC star'string(instr$)
  DIM star$ OF 40, string$ OF 40
  string$:=""* "+instr$+" "*"
  star$:=""
  FOR i:=1 TO LEN(string$) DO star$:"+*"
  PRINT star$
  PRINT string$
  PRINT star$
ENDPROC star'string
```

The first line prompts the user for an input. The second line executes the "star string" procedure which is defined in the following lines. The FOR-DO statement does not extend past the end of its line. The program logic should be easily understandable with a little study even for those who are not familiar with the language. Interesting solution, Michael.

Examples typical of most other submissions are listed below:

```
1 REM PROBLEM #13-1 : STARRED STRING (SC
REEN ONLY)
10 INPUT A$:PRINT"[DOWN]* "A$ " *":FOR X=
1 TO LEN(A$)+4:PRINT"[UP][UP]*[DOWN][DOW
N][LEFT]*";:NEXT
```

```
1 REM PROBLEM #13-1 : STARRED STRING (PR
INTER/SCREEN)
10 INPUT A$:FOR X=1 TO LEN(A$)+4:X$=X$+"
*":NEXT:PRINT X$:PRINT"* "A$ " *":PRINT X
```

Both of these programs are one-liners if you use abbreviations and omit spaces. Variations on these themes involved using MID\$ and LEFT\$, and some programs called a star-printing subroutine. To give credit where it's due, here is a pseudo-randomly arranged list of readers with workable solutions to this and some of the other problems:

Jimmy Toten (Hawthorne, CA)	Greg Smisek (Lonsdale, MN)
R.W. Kober (Buffalo, TX)	Marcus Cooper, Jr. (Mililani, HI)
Milton Powell (Portsmouth, NH)	John Immarrino (Hackensack, NJ)
Daniel Miller (New York, NY)	Greg Sheppard (Tacoma, WA)
Kenneth Karow (Chicago, IL)	Michael Hooper (Tyler, TX)
Eric Biberhofer (Dundas, ONT)	Harold Hughes (Robstown, TX)
Dave Patterson (San Jose, CA)	Ronald Sipe (Cincinnati, OH)
Heike Hamacher (Tulsa, OK)	John Bucy (Belpre, OH)
Dan Berger (Marshfield, WI)	Douglas Gristina (Florence, AL)
Fred Randall (Uxbridge, MA)	Barry Friedman (No. Miami, FL)
Stephen Vanderhoof (Albany, NY)	Steve Liggett (College Park, GA)
Mark Harris (Blue Springs, MO)	Kurt Huebner (Anchorage, AK)
Jim Root (Whimore Lake, MI)	John Prager (Bay City, MI)
Richard Bertke (Perryville, MO)	James E. Borden (Carlisle, PA)
David Wright (New Britain, CT)	Todd Growney (Livingston, MT)

Garrett Kearney (Clay, NY)	Jon Phillips (Sierra Vista, AZ)
Alan Christman (Romeo, MI)	Charles Foreman (Dayton, TX)
Bill Imrisek (Bancroft, ONT)	Adolpho Rodriguez (Newark, NJ)
Brian Wilcox (Coldwater, OH)	Robert Rice (Oak Park, MI)
Shawn K. Smith (Bronx, NY)	Doug Chapman (Belleville, KS)
Tim Stonis (Cranbury, NY)	David Handwerker (Davison, MI)
Mike Bouska (Williamsburg, KS)	Jeff Lambert (Honesdale, PA)

Your letters indicate you enjoy solving the *Commodores*. Occasionally readers ask for more challenging problems. Our goal is to present problems which can be solved with short to moderate-length programs for people with a wide range of interests and abilities. As always, if you have a problem that you have solved or would like solved, submit it so that we might dare the rest of the world to try it. *Commodores* will be as challenging as you make them.

Problem #13-2: Auto Run brought some hints, tips, and solutions from R.W. Kober (Buffalo, TX), James E. Borden (Carlisle, PA), Antoine Alary (Montreal, QUE), Todd Growney (Livingston, MT), Jim Zdunic (East Leroy, MI), Richard M. Bertke (Perryville, MO), and William H. Fossett of Hacker's Hardware (P.O. Box 7933, San Diego, CA 92107).

Jim Zdunic's program listed below is used for auto-loading the next program from tape. After typing and saving his program, you activate it by typing RUN, NEW, and then SYS 7669. From then on, the next tape program will be automatically loaded and run whenever you type SYS 7669.

```

Call us the modern way— on Ahoy!'s Bulletin Board System!

If your computer is equipped with a modem, you can call Ahoy!'s Bulletin Board System any hour of the day, any day of the week to exchange electronic mail with other Commodore users or download files like the following:

- Editorial calendar for upcoming issues
- Excerpts from future editions of *Scuttlebutt*
- Corrections to programs and articles
- Detailed descriptions of back issues
- Program disk and subscription information
- Classified advertising

Set your modem for 300 baud, full duplex, no parity, 1 stop bit, 7 word length, and dial away!

System Configuration of Ahoy! Bulletin Board System:

**NEW NUMBER (AS OF APRIL 15):
718-383-8909**

If you use the Wedge with your disk system, you may autorun a BASIC program by typing "[UP ARROW] filename" where [UP ARROW] is the key next to the Restore key. James Borden and Antoine Alary pointed out that you may type the following to autorun a BASIC program without the Wedge:

```
LOAD "[FILENAME]",8 : [SHIFT-RUN/STOP]
```

The program below from Hacker's Hardware is the most versatile and easiest to use for creating a BASIC autoloader file. The user specifies the loader's name (for example, LDR) and the name of the BASIC program to be loaded (for example, TEST). Then the program creates the file LDR and puts it on the same disk as TEST. To autorun TEST, enter LOAD "LDR",8,1 or using the Wedge, simply enter %LDR.

```
5 REM  -- CREATE AUTO-RUN LOADER --

Mr. Fossett invites readers to contact him at the address above if you are interested in an explanation as to how the program works. Several readers did some serious work on this problem.

There were basically two groups of solutions to *Problem #13-3: Micro Calc*, those that POKE 631 and those that don't. (The 631 refers to the first location of the keyboard buffer, for those of you who haven't memorized the memory map of the C-64.) First of all, some of you may have wondered, as did Michael Hooper (Tyler, TX), why would anyone want a program like this when the computer already performs calculations very simply in the immediate mode? The answer is that this was intended to be a parsing problem, a task frequently encountered in writing compilers and computer languages. Although it took some serious work and some clever programming to create some of the keyboard "buf-

fer-stuffer" solutions, those programs don't provide much insight into the parsing problem. Certainly no one would type or load a program to accomplish a task they could do without a program.

The shortest example of a solution using the keyboard buffer was from Michael Hommer (Waukee, IA). The essence of this type of program is to POKE keystroke ASCII values into the keyboard buffer which begins at location 631. The number of keystrokes waiting in the buffer is POKEd into location 198. Once the BASIC program is run and returns to immediate mode, the computer reads the keystroke data from the buffer, just as it would if you had pressed those keys.

```
1 REM PROBLEM #13-3:MICRO CALC
2 REM SUBMITTED BY MICHAEL HOMMER
3 REM
5 INPUTA$:A$="?"A$:PRINT"=:PRINTA$:M=6
31:C=145:POKEM,C:POKEM+1,C:POKEM+2,C:POK
EM+3,13:POKE198,4
```

The 145's correspond to [CURSOR UP] keystrokes and 13 is the ASCII value of the [RETURN] key. Other readers' solutions of this type included fancy color changes to hide intermediate output on the screen. If you haven't tried programming like this, you're in for some fun and interesting possibilities. Combine these keyboard buffer ideas with the autorun programs above, and your computer could get along without you for days at a time.

Parsing is the process of breaking the input sequence into its components and identifying or arranging them so that the desired operations can be performed. Shawn K. Smith (Bronx, NY) and Greg Smisek (Lonsdale, MN) sent similar solutions as listed below. Theirs were the most compact programs. Other readers took somewhat the same approach.

```
1 REM PROBLEM #13-3:MICRO CALC
2 REM SUGGESTED BY GREG SMISEK
3 REM AND ALSO BY SHAWN K. SMITH
4 REM
10 INPUT"EXPRESSION";C$:FORX=1TOLEN(C$):
X$=MID$(C$,X,1)
20 IF X$="+" OR X$="-" THEN C=C+VAL(N$):
N$=""
30 N$=N$+X$:NEXT:PRINT"THE ANSWER IS ";C
+VAL(N$):PRINT:RUN
```

James Dunavant (Gainesville, FL) converted the keystrokes into their BASIC tokens and POKEd them directly into his BASIC program following a PRINT statement. Perhaps the most expandable approach is this one from John Prager (Bay City, MI).

```
1 REM PROBLEM #13-3:MICRO CALC
2 REM SUBMITTED BY JOHN R. PRAGER
3 REM
30 PN=1
```

```

40 GET A$:IF A$="" THEN 40
50 IF A$>="9" AND A$<="9" THEN N=N*10+VAL(A$):CR=1:PRINT A$;:GOTO 40
60 IF A$="-" AND CR THEN GOSUB 120:PN=-1:GOTO 40
70 IF A$="." THEN PRINT A$;:PN=-PN
80 IF A$="+" AND CR THEN GOSUB 120:PN=1:GOTO 40
90 IF A$=" " THEN PRINT A$;:GOTO 40
100 IF A$<>CHR$(13) THEN 40
110 GOSUB 120:PRINT"THE ANSWER IS ";S;".":PRINT:RUN
120 PRINT A$;:S=S+N*PN:PN=1:N=0:CR=0:RETURN

```

John's solution properly handles an input such as "-2". If you want to test the flexibility of your approach to this problem, see how easily you could modify your program to properly handle multiplication as well as addition and subtraction.

Problem #13-4: Data Lister was also a good parsing

problem. The solution from Fred Randall (Uxbridge, MA) is listed below. His program is typical of several other readers' approaches to this one.

```

10 REM PROBLEM #13-4: DATA LISTER
20 REM SOLUTION BY FRED RANDALL
25 REM
30 N=20:DIM D$(N)
40 FOR J=1 TO 20:D$(J)=CHR$(64+J):NEXT J
50 INPUT"VIEW WHICH DATA";V$
60 L=LEN(V$):X=VAL(V$):X$=STR$(X):Y=LEN(X$)+1:Y$=MID$(V$,Y,L):Z=VAL(Y$)
70 IF L=LEN(X$)-1 THEN PRINT D$(X):END
80 IF Z=0 THEN Z=N
90 IF X<0 THEN Z=ABS(X):X=0
100 FOR I=X TO Z:PRINT D$(I):NEXT I

```

We have room for one final micro-challenge. When are spaces mandatory for proper syntax in a BASIC program? Never, you say? Think about it. See you next month with a new round. □

MOVING THROUGH *Color Memory*

Continued from page 22

string you want PRINTed, converts the ASCII characters to screen display codes, goes to screen memory, finds the current cursor position, and stores each character code in the correct address. It does it all automatically, far faster than you could do it by POKEing the screen codes into memory yourself.

But, as you know, part of that string can include "color" characters. For instance, CHR\$(5) is the code for the color white. If you PRINT CHR\$(5), every character PRINTed after that will appear white.

Yet there is no screen display code for "white," just as there is no screen display code for any of the other command characters, like carriage returns, cursor movements, or inverse on-off. These command characters are like a mini-language, telling the PRINT command what you want done with subsequent strings.

When you use a color command character, PRINT takes it as an instruction to PRINT all subsequent characters in that color.

But where is color controlled? It can't be controlled in screen memory, since there are 256 possible characters (include inverse characters) that can be coded. All eight bits of each address of screen memory are used just to determine which character will be displayed—there is no bit left over for color.

Instead, color has its own map, which corresponds exactly with screen memory. In the 64, color memory starts at location 55296 and includes all 1000 bytes through location 56295. In the VIC with less than 8K, color memory starts at 38400 and extends through 38905. (Expanded VICs find color memory at 37888 through 38393.)

When you PRINT a red Q in the upper left-hand corner of the screen, with the command PRINT CHR\$(31) "Q", BASIC goes to the first address in screen memory and stores the code for Q. Then it goes to the first address in color memory and stores the code for *red*.

This is why the 64 can have a different foreground color for every position on the screen. Any position can be displayed in any of the 16 available colors, because each screen position has a character code in screen memory and a color code in color memory.

To see how this works, try this simple program. Line 10 fills the screen with random characters; line 20 fills color memory with random colors. Here is the 64 version:

```

10 SM=1024:FOR I=SM TO SM+999:POKE I,INT(256*RND(9)):NEXT I
20 CM=55296:FOR I=CM TO CM+999:POKE I,INT(16*RND(9)):NEXT I
30 GOTO 20

```

And here is the unexpanded VIC version (for expanded VICs, change the value of SM to 4096 and CM to 37888):

```

10 SM=7680:FOR I=SM TO SM+505:POKE I,INT(256*RND(9)):NEXT I
20 CM=38400:FOR I=CM TO CM+505:POKE I,INT(16*RND(9)):NEXT I
30 GOTO 20

```

Notice that because we POKed the characters into screen memory, we could use the lower right-hand corner of the screen. The PRINT command automatically scrolls the screen display when a character is PRINTed in that position, but POKE, slow as it is, has the virtue

of leaving the rest of the screen alone when it puts a character there.

Now, you can easily see how we can accomplish highlighting certain positions on the screen *without* disturbing what is PRINTed there. We simply change the colors of that row in color memory, and regardless of what characters are coded to appear on that row in screen memory, they will have the color we assigned them in color memory.

That is how the example program *Menu* works. The options are PRINTed on rows 5, 6, 7, 8, and 9, all starting at the fourth character from the left. No option is longer than 16 characters. So the movement routine tracks five different addresses in color memory, which correspond to the starting positions of the five options. These addresses are held in the array C0(n).

When the player calls for a change in the current choice displayed, the variable NP is set to the number of the new position, and the variable XP is set to the number of the old position.

To highlight an option, the routine at line 900 POKes the highlight color code into the sixteen color memory addresses starting at the address C0(NP). To put an option back to normal, the routine at line 920 POKes the regular color code into the sixteen color memory addresses starting at C0(XP).

Movement up and down responds to the f7 and f5 keys; the space bar is used to select.

The virtue of this program is that if you were changing menus, the same routines could be used to change colors in certain positions on the screen regardless of what characters were displayed there.

You will also notice that RUN/STOP and RESTORE are disabled at the beginning of the program. However, the program checks to see if RUN/STOP has been pressed—if it has, everything is set back to normal and the program ends. This is an example of how to keep the idiots savant from trashing the display. In this program, of course, it doesn't matter—but in the next one it does.

COLOR CODES

The color codes that you must POKE into color memory are identical to the color codes you POKE into the background color register to change the background color:

0 = black	8 = orange
1 = white	9 = brown
2 = red	10 = light red
3 = cyan	11 = dark grey
4 = purple	12 = medium grey
5 = green	13 = light green
6 = blue	14 = light blue
7 = yellow	15 = light grey

By the way, you can't just PEEK into color memory to read what color is stored there. That's because only the lower four bits of each color memory address loca-

tion are under control. The upper four bits contain garbage. So to read color memory accurately, you must perform the operation AND 15 with the number you find there to get rid of the high nybble (the highest four bits), like this:

```
A=PEEK(CM+53)AND 15
```

After that statement, the variable A would contain the code for the color displayed in the 54th byte of color memory. (Remember, the first byte is CM+0, so that CM+53 is the 54th byte.)

FAST HIGHLIGHTING THRU FAKERY

The program *Menu* is slow. POKEing sixteen positions in color memory takes time, and the response feels sluggish.

But there's an easy way to speed things up on the 64. We can use PRINT to change color memory *without* changing screen memory—by fooling BASIC into thinking screen memory is somewhere else.

You may remember from earlier jaunts through the video memory system that there is one location that tells the VIC chip where screen memory is, and another location that tells BASIC where screen memory is. BASIC uses its number when it is PRINTing character codes into screen memory; the VIC chip uses its number when it is scanning to see what patterns to display on the screen.

That means that if we tell BASIC that screen memory is in one place, and tell the VIC chip that it's in another, BASIC can PRINT all day and the VIC chip will never see it—it will still be looking in its own place for screen memory.

However, while BASIC is PRINTing invisible characters, all its *color* changes will be visible, because both BASIC and the VIC chip will be using the same color memory.

The example program *Fast Menu* shows how this is done. The options are PRINTed in screen memory at 1024, just as usual. But then the BASIC screen memory pointer at 648 is changed from 4 to 60. This tells BASIC to PRINT things at page 60, or address 15360 (that is, 60*256).

The program then PRINTs one string, XC\$, to set a row back to normal, and another string, HC\$, to highlight a row. It does a whole row (except the last character) each time, so that the option could be of any length.

The strings consist of the color command character plus 39 commas. They didn't have to be commas. They could have been anything, including blanks. What matters is that color memory is changed—we don't care what

Continued on page 114

TILE TIME FOR THE C-64

By Larry Murdock

Tile puzzles, the predecessors of the more recently popular cube games, were little plastic boards on which were laid several small interlocking tiles. Each tile or square had a number, a picture, or a letter of the alphabet printed on its face. When you received the game it was in order. You subsequently moved the pieces around to mix up the puzzle, then attempted to put it back in order.

Tile Time is just such a puzzle. Type it in and SAVE it.

When RUN, the puzzle will appear and a message at the bottom will read "JOYSTICK OR KEYBOARD J/K". If you select "K" the "cursor" can be positioned from the keyboard; up with an "A", down with a "Z", left with a "J", and right with a "." (see lines 7000 to 7080). Hit the spacebar and the tile or tiles will move. If you wish to use the joystick, plug it into port number two (see lines 2000 to 2130). If you want to move one tile, position the cursor on the tile you want moved and hit the fire button or spacebar. If you want to move more than one tile, position the cursor on the last tile you want moved and hit the fire button or spacebar. If you want to start all over, hit SHIFT and CLR/HOME simultaneously.

After you respond to the "JOYSTICK" question, the screen will read "MIX Y/N". If you respond with a "Y" the puzzle will mix itself with 50 quick random moves (you can halt the mixing process at any time, by hitting any key—see lines 4000 to 4200). If you respond with a "N" then you can "MIX" it up yourself.

The code is kind of interesting and you can have some fun changing it around. The machine code scrolling is POKed in via DATA statements (see lines 9000 to 49790). You can change the face of the puzzle to anything you want (see lines 290 to 310). The colors of the rows can be changed by altering the number codes in line 110. For younger players you can change one whole row to "A" 's and another to "B" 's, etc. If you don't speak well English you can change all the letters to numbers. If you confuse easily you can change every tile to the same thing so that no matter how mixed the tiles are, they will be in the right order. □

COMMODORE FONT EDITOR FOR THE C-64

BY PHILLIP CASE

Have you ever wondered how your computer knows to display the letter "A" when it's told to—especially when all it really understands is 1's and 0's? The answer lies in something called the Video Character Generator or Character Matrix.

Simply put, this is a Read Only Memory (ROM) which is filled with data that tells the computer what each character in the alphabet is supposed to look like.

Whenever the computer needs to display an "S," for example, it looks through the ROM until it finds the correct data for displaying an "S" on the screen. And since this matrix of data is stored in ROM, it's ready as soon as you turn on your Commodore 64.

Suppose you could change the data in the character matrix so the computer would display your own character set instead of the original. You could easily make your screen characters appear in Old English, or even other languages such as Russian or Greek, complete with their special letters. You could define special characters such as smiling faces, Pac-man, stars, etc. Imagine the impact of a game with a special character font to

match the game theme. All this can be done.

The ROM which stores this character matrix cannot be altered, but there is a vector in the Commodore 64 which tells the computer where the ROM is. This vector is in RAM, which means it can be changed.

Therefore, if we change the vector so it looks into RAM to get the character matrix, we can have our own character information right there waiting for it. The purpose of the *Commodore Font Editor* is to provide an easy interface to create character fonts. The program itself is straightforward with few tricks. Type the program in slowly and try to understand each module as it is entered.

Before trying to design a character font, first develop it on paper. This allows you to verify the consistency between letters before you go into the editor. First, make up a character matrix such as the one pictured here. Then

define your character within the box. Remember to leave one side column and either the top or bottom row empty so your characters won't touch each other on the screen. If, of course, you are defining a cur-

sive font, you will want the characters to connect with some sort of standard so they look consistent.

Also, you should not leave blank columns if you are designing special symbols that require more than one character, like a pointing hand.

USING THE FONT EDITOR

The first thing the program does after you type "RUN" is to load the character area with the data that is stored in ROM. This takes about 30 seconds and is only done the first time you type "RUN." If you stop the program and type "RUN" a second time, the program will not get the ROM characters. This is designed to prevent the program from wiping out a font you've been designing. The program checks for this by looking at the top row of the "@" character (Screen code 0), so don't alter the top row of this character.

After initializing the system, the program presents the main menu. From this point, you can go anywhere in the editor.

Note: the character codes displayed and inputs requested are not ASCII, but rather the Commodore Screen Codes, given on page 132 of the *C-64 User's Guide* and page 376 of the *C-64 Programmer's Reference Guide*.

Also, the character buffer for the font editor is from 12288 to 14335 (3000H to 37FFH). The program and variable areas from 2048 to 12287 (800H to 3000H). The program protects the character buffer from BASIC so your characters will not get wiped out by accident. □

trol of your computer to you in case of lockup. Four RENEW programs will restore the BASIC program in memory before throwing the switch. The unit's two female serial ports permit the use of two printers, and its two-foot cord acts as an extension to your serial bus.

\$24.95 postpaid from Master Software, 6 Hillery Court, Randallstown, MD 21133 (phone: 301-922-2962).

BLUE CHIPS

The *Commodore Investor's Newsletter* is offered free to Commodore owners interested in playing the stock market. A copy can be obtained by sending a stamped and self-addressed business size envelope to Dr. Lynn Harner, 2011 Central, Dodge City, KS 67801 (phone: 316-227-8952).

APPLICATION TEMPLATES

Fabtronics has produced application templates for Microsoft's Multiplan for the Commodore 64. Current templates, priced at \$11.95

for documentation and software (\$6.95 for documentation alone), include home budget, accounts payable, accounts receivable, inventory management, check ledger, and invoicing.

Fabtronics, 51 Quarry Street, Brockport, NY 14420 (phone: 716-637-6371).

Cooperative Design is looking for individuals to write application overlays (to be called Magnetic Templates) for various C-64 spreadsheet and database programs. They will encourage users to modify, copy, and distribute these programs, with each new user voluntarily mailing in payment. Authors will receive 25 percent of all sales.

Send a stamped and self-addressed envelope to Cooperative Design at 129 Anthes, Box 138, Langley, WA 98260 and you'll receive a catalog of available and coming templates. If you'd like submission guidelines, send a list of templates you could develop and templates you'd like to see.

Also available: blank cardstock Personal RAM boards which fit around the keys of your 64 or VIC, providing space for notes for particular programs. Package of 12: \$9.95.

1200 BAUD MODEM

U.S. Robotics has signed an agreement with Commodore International to manufacture a 1200/300 bit-per-second modem with automatic phone dialing and other advanced features. It will be marketed by Commodore as the Commodore Modem/1200 (model 1670).

The new modem will be compatible with the 128, 64, Plus/4, SX-64, and VIC 20 computers. As well, it will feature Hayes compatibility and a built-in speaker that will allow users to hear the call being dialed.

U.S. Robotics, Inc., 8100 McCormick Blvd., Skokie, IL 60076 (phone: 312-982-5010).

ERRATA

Please note the following omissions/errors in previously published *Ahoy!* programs:

MANSION DISPLAY SETUP (March 1985):

The following line did not appear in print. Please insert it:

52723 DATA "[s U]X"

Some of you may have been confused by the extra open bracket in lines 52404 to 52408, and the extra close bracket in lines 52511 to 52517. These extra brackets appear not by mistake, but as characters which are printed to the screen.

OLD ROUTINE (March 1985):

We neglected to mention that the first byte of the program is 8000 and the last byte is 808C.

HOME BUDGET (March 1985):

Line 380, mangled during printing, should read as follows:

380 PRINT"[DOWN][DOWN]MONTHLY TOTAL"TAB(14)Q+AA+BB

We regret any inconvenience these errors may have caused. Corrections to *Ahoy!* programs and articles are posted on our bulletin board (718-383-8909 as of April 15) as soon as they are spotted.

REVIEWS

Continued from page 74

since all the messages are in plain English anyway.

Together *PFS:File* and *PFS:Report* make a good team.

PFS: Report adds number-crunching and printer options to File.

READER SERVICE NO. 236

They give you all the important database features and *File* throws in a powerful extra. Your format is perfect, you're entering data; but you would really like to attach a note to one record. Just call up another page (for that one record only) and type your note. As simple as that. Just as the description of this feature is tacked onto the end of this review, *File* can attach a note to any record—and use a minimum of disk space to boot.

Software Publishing Corporation, 1901 Landings Drive, Mountain View, CA 94043 (phone: 415-962-8910).

—Richard Herring

PROGRAM LISTINGS

Attention new *Ahoy!* readers! You must read the following information very carefully prior to typing in programs listed in *Ahoy!* Certain Commodore characters, commands, and strings of characters and commands will appear in a special format. Follow the instructions and listing guide on this page.

On the following pages you'll find several programs that you can enter on your Commodore computer. But before doing so, read this entire page carefully.

To insure clear reproductions, *Ahoy!*'s program listings are generated on a daisy wheel printer, incapable of printing the commands and graphic characters used in Commodore programs. These are therefore represented by various codes enclosed in brackets []. For example: the SHIFT CLR/HOME command is represented onscreen by a heart . The code we use in our listings is [CLEAR]. The chart below lists all such codes which you'll encounter in our listings, except for one other special case.

The other special case is the COMMODORE and SHIFT characters. On the front of most keys are two symbols. The symbol on the left is obtained by pressing that key while holding down the COMMODORE key; the symbol on the right, by pressing that key while holding down the SHIFT key. COMMODORE and SHIFT characters are represented in our listings by a lower-case "s" or "c" followed by the symbol of the key you must hit. COMMODORE

J, for example, is represented by [c J], and SHIFT J by [s J].

Additionally, any character that occurs more than two times in a row will be displayed by a coded listing. For example, [3 "[LEFT]"] would be 3 CuRSor left commands in a row, [5 "[s EP]"] would be 5 SHIFTEd English Pounds, and so on. Multiple blank spaces will be noted in similar fashion: 22 spaces, for example, as [22 " "].

Sometimes you'll find a program line that's too long for the computer to accept (C-64 lines are a maximum of 80 characters, or 2 screen lines, long; VIC 20 lines, a maximum of 88 characters, or 4 screen lines). To enter these lines, refer to the *BASIC Command Abbreviations Appendix* in your User Manual.

On the next page you'll find our *Bug Repellent* programs for the VIC 20 and C-64. The version appropriate for your machine will help you proofread our programs after you type them. (Please note: the *Bug Repellent* line codes that follow each program line, in the whited-out area, should *not* be typed in. See the instructions preceding each program.) □

When You See	It Means	You Type	You Will See	When You See	It Means	You Type	You Will See
[CLEAR]	Screen Clear	SHIFT CLR/HOME		[BLACK]	Black	CNTRL 1	
[HOME]	Home	CLR/HOME		[WHITE]	White	CNTRL 2

[EP]	English Pound	£		[F7]	Function 7	F7	
				[F8]	Function 8	SHIFT F7	

IMPORTANT! Letters on white background are **Bug Repellent** line codes. Do not enter them! This and the preceding page explain these codes and provide other essential information on entering **Ahoy!** programs. Read these pages before entering programs.

BUG REPELLENT

This program will let you debug any **Ahoy!** program. Follow instructions for VIC 20 (cassette or disk) or C-64.

VIC 20 VERSION

By Michael Kleinert and David Barron

For cassette: type in and save the **Bug Repellent** program, then type RUN 63000[RETURN]SYS 828[RETURN]. If you typed the program properly, it will generate a set of two-letter line codes that will match those listed to the right of the respective program lines.

Once you've got a working **Bug Repellent**, type in the program you wish to check. Save it and type the RUN and SYS commands listed above once again, then compare the line codes generated to those listed in the magazine. If you spot a discrepancy, a typing error exists in that line. Important: you must use exactly the same spacing as the program in the magazine. Due to memory limitations on the VIC, the **Bug Repellent** will register an error if your spacing varies from what's printed.

You may type SYS 828 as many times as you wish, but if you use the cassette for anything, type RUN 63000 to restore the **Repellent**.

When your program has been disinfected you may delete all lines from 63000 on. (Be sure the program you type doesn't include lines above 63000!)

For disk: enter **Bug Repellent**, save it, and type RUN:NEW[RETURN]. Type in the program you wish to check, then SYS 828.

To pause the line codes listing, press SHIFT.

To send the list to the printer type OPEN 4:CMD 4:SYS 828[RETURN]. When the cursor comes back, type PRINT#4:CLOSE 4[RETURN].

C-64 VERSION

By Michael Kleinert and David Barron

Type in, SAVE, and RUN the **Bug Repellent**. Type NEW, then type in or LOAD the **Ahoy!** program you wish to check. When that's done, SAVE your program (don't RUN it!) and type SYS 49152[RETURN].

To pause the listing depress and hold the SHIFT key.

Compare the codes your machine generates to the codes listed to the right of the respective program lines. If you spot a difference, an error exists in that line. Jot down the number of lines where

contradictions occur. LIST each line, spot the errors, and correct them.

FLANKSPEED FOR THE C-64

By Gordon F. Wheat

Flankspeed will allow you to enter machine language **Ahoy!** programs without any mistakes. Once you have typed the program in, save it for future use. While entering an ML program with **Flankspeed** there is no need to enter spaces or hit the carriage return. This is all done automatically. If you make an error in a line a bell will ring and you will be asked to enter it again. To LOAD in a program Saved with **Flankspeed** use LOAD "name",1.1 for tape, or LOAD "name",8.1 for disk. The function keys may be used after the starting and ending addresses have been entered.

f1—SAVES what you have entered so far.

f3—LOADs in a program worked on previously.

f5—To continue on a line you stopped on after LOADing in the previously saved work.

f7—Scans through the program to locate a particular line, or to find out where you stopped the last time you entered the program. f7 temporarily freezes the output as well.

PROGRAMMERS...

We're always interested in looking at top-quality programs for the Commodore home computers. However, a great many factors other than the talent of the programmer contribute toward making a program top-quality. Before submitting a program to Ahoy!, we recommend that you send a stamped and self-addressed letter-size envelope to Ahoy! Writer's and Programmer's Guidelines, Ion International Inc., 45 West 34th Street—Suite 407, New York, NY 10001.

94 AHoy!

MOVING THROUGH *Color Memory*

Continued from page 80

BASIC does with memory where it thinks screen memory is. The VIC chip is still looking at 1024, which BASIC isn't changing.

Now, if you are using this technique in a long program, then of course you'll have to move video memory to a higher block. As it stands, your program would only have the space between the end of screen memory at 2048 and the beginning of BASIC's screen memory at 15360. That's fine for this example program, but a long game would need more elbow room. For the technique of moving video memory, see the column two months ago, which played games with memory like you wouldn't believe.

This technique will also work with the VIC, which also has its BASIC screen memory pointer at 648. However, it is almost worthless to try this technique unless you have expanded memory beyond 8K; if you do have an expanded VIC, you should have little trouble translating this program from the 64 version included in this issue.

WORMS IN COLOR MEMORY

You can do a lot more with color memory than just highlight options. Remember that the character patterns only decide which dots in a character cell display foreground color and which display background color. It's color memory that does the rest. For example, you could fill the entire screen with characters, but if the background color and the foreground color were the same, the screen would look completely blank. Only when you changed color memory would any portion of the screen become visible.

So here is a rudimentary game that lets you control a worm moving around the screen. Every character on the screen is the same—CH\$(90), the diamond-shaped dot. However, most of them are invisible. Some of them are orange—these are the segments of the worm. Some of them are green—these are food. When the worm eats food, it gets longer.

The worm is run through the array variable WM(n). Each element of the array represents a segment of the worm; each element contains the address of that seg-

ment in color memory. Every time the worm moves, all the addresses are changed in the array WM(n), as segment 2 is now "located" where segment 1 used to be. But only the first and last segments need to be POKed—the first segment is changed to the worm color, CW, and the last segment is changed to the background color, CB. When 12 bits of food have been "eaten" and the worm is 15 segments long, the game starts over.

Use f7 and f5 for vertical movement, SHIFT and COMMODORE for horizontal movement. Press RUN/STOP to end the game. Both VIC and 64 versions are included in the program listings section.

Next month we'll take a close look at a fantastic program from Electronic Arts: *Seven Cities of Gold*. And we'll look at ways to make a program respond to the player's behavior, so that the whole mood of a game can take on the personality the player shows while playing.

What we're talking about is, in a sense, behavioral conditioning. By setting up a reward and punishment system, we'll be encouraging some actions and discouraging others. It's just as the parents of videogame players always suspected—we game designers *are* out to turn our players into puppets!

Thanks to Walter Meyers and Jan Iverson for sending me their excellent games. Both of you set difficult problems for yourselves and solved them admirably. I only wish you were offering them for publication, so that other readers could see some of the dazzling things that can be done with resourceful and creative game programming.

Also, thanks to Derward F. McKinney, who kindly sent in all the changes that would be necessary to allow *The Emerald Elephant of Cipangu*, from one of these columns last fall, to run on the VIC 20 (with at least 16K). If anyone would care to have a copy of his letter, send a stamped, self-addressed envelope to:

Elephant for VIC
546 Lindley Road
Greensboro, NC 27410

I'll xerox Mr. McKinney's letter and send you a copy. Since I don't have memory expansion on my VIC, I can't test his changes, but I assume they work. □

ACCESS

BEACH-HEAD — As chief commander of armed forces in the Pacific, your first assignment is a tough one. Your mission is to obtain a quick naval victory and invade enemy territory with land forces. **BEACH-HEAD II** — The wartime drama continues with "The Dictator Strikes Back." **BEACH-HEAD II** is a true "head to head" two player game with voice simulation and superb multiscreen graphics. **RAID OVER MOSCOW** — The Soviets launch a first strike against the United States. Can your commandos react in time to stop the attack?

Mach 5 is a collection of powerful programs that enhance the capabilities of the C-64 with a 1541 disk drive. The package provides up to 500% faster program loading, 4K of additional basic workspace and disk cataloging.

Mach 5 Loader will load 95% of all programs up to 500% faster than a normal 1541 disk drive. Adds addition "single keystroke" commands to make life with your 1541 more pleasant. Mach 5 Basic modifies the C-64 kernel and basic ROMs to free up an additional 4K bytes of memory for use by basic language programmers. The workspace is increased from 39K to 43K while remaining fully compatible with normal CBM version 2 basic and Mach 5 Loader.

Mach 5 Disk Organizer is a comprehensive disk management program which will create a data disk containing directory information from the user's entire disk library. Disk names, file names and other important information is automatically extracted from a disk and cataloged for future reference. The user can then obtain a sorted list of all disks and all files within their library, or search for specific file names or parts of names. Output can be directed to either screen or printer.

ACCESS

Software Incorporated

These Access Software products are compatible with the Commodore 64, Atari, Apple II+/IIc/IIe and IBM PC/PC Jr. Be sure to look for other Access Software products at a store near you.

TIRED OF WAITING FOREVER FOR YOUR PROGRAMS TO LOAD?

INTRODUCING THE FAST LOAD CARTRIDGE FROM EPYX.

You're tired of waiting forever for your Commodore 64 programs to load. But it's no use glaring at your disk drive. Calling it names won't help, either. It was born slow — a lumbering hippo. You need the FAST LOAD CARTRIDGE from Epyx. FAST LOAD transforms your Commodore 64 disk drive from a lumbering hippo into a leaping gazelle. With FAST LOAD, programs that once took minutes to load are booted up in a matter of seconds.

FAST LOAD can load, save and copy your disks five times faster than normal. It plugs into the cartridge port

of your Commodore 64 and goes to work automatically, loading your disks with ease. And that's only the beginning. You can copy a single file, copy the whole disk, send disk commands, and even list directories without erasing programs stored in memory.

And unlike other products, the FAST LOAD CARTRIDGE works with most programs, even copy protected ones, including the most popular computer games.

The FAST LOAD CARTRIDGE from Epyx. Easy to insert, easy to use and five times faster. So why waste time waiting for your disks to load?

Speed them up with FAST LOAD!
